I was out of town over the weekend, I came back and got on Renegade but it did not work. The logo came up but after that nothing happened. I have the latest version of Direct X and my drivers are up to date. Everything should be working because like I said I was only gone over the weekend and I play quite frequently. I have tried uninstalling and reinstalling four times now. Also I appologize for bringing up a topic that was made befor. The people in that topic did not solve the problem.

Ok, i saw this post and thought of you.

Ok, run the attached application, click the big button and it may be fixed.

All this does is change a few of your registry keys. Trust me it will not screw up you system, im not like that.

Well, i would suggest going;

Start
|
-Programs
|
--Westwood
|

---Renegade
|
----Renegade Config

Make sure there is a video driver listed in the main window and it is selected, if not, reinstall your video drivers. Try messing around with the resolution and colour depth. Before that you could try running it in window mode. If those fail, set the bar in "Performance" to Low (Fastest).
