
Subject: Renguard/Norton Problems

Posted by [rc22fires](#) on Thu, 20 Oct 2005 15:51:12 GMT

[View Forum Message](#) <> [Reply to Message](#)

I recently have had a problem and I posted it in the =[UN]= forums for asistance.(posted there because I did not suspect it was RG at the time)

RC22Fires in UN forums

I simply turn off my computer for 3 hours because thats usually all the sleep I need. Guess what I get when I turn it back on.

Seems I can't delete it ffs.

Sigh :-[

Hey look norton has more to say!

Yikes thats not good. FFS

Oh and to top it all off ever since this started I can't start renguard.

- This is all I get when trying to start RG.

OMFG What do I do?

Hmmmm and what happend was I got some very nice replys.

One of the 1st ones I got worked.

Enforcer's reply in UNforums

http://securityresponse.symantec.com/avcenter/venc/data/hack_tool.rootkit.html

READ FOLLOW THE INSTRUCTIONS CAREFULLY

You see these virus messages I got appeared yesterday and I followed the instructions and quarantined it. Had no problems.

Until I started Renguard again. I got the message right when I double clicked game.exe

So I told a buddy clan member of mine and said he had the same problem. I managed to ask him when it occurred. He said yesterday.

ZOMG when it happened to me. His Renguard was starting for him and he did not get "failed to initialize" message as I did. What he did was reinstall Renguard and now he is not getting the virus alert messages. I am going to reinstall Renguard now. If this works I will postreply. If it does not I will probably postreply.

Ok I talked to my clan bud again. He said that his Norton try icon was there but it wasn't actually loaded. After moving cursor over vanished and anyway once again it happens only when starting Renguard. At least he can play ffs.

No it doesn't.

The "couldn't initialize service" error is a firewall problem.

Parad0x wrote on Thu, 20 October 2005 12:26No it doesnt.

The "couldn't initialize service" error is a firewall problem.

How could it be a firewall problem when I have not configured or changed my firewall in anyway before this started happening.

Also It can't be a firewall problem because right before this message comes up game.exe doesn't even become a process for a milisecond. IE it does not come on at all. Renguard needs to be able to initialize before it can try to connect.

No sorry, I was not specific. The screenshots I previded were, You were not talking about what I am talking about. I know what error you mean.

I am talking about Error: loader couldn't initialize service!

I also have a problem with this happening. Only my situation is a little better. Although each time i start renguard Norton Anti-virus warning pops up and says virus found called Hacktool.Rootkit, i

can still play renegade with renguard. Seems a bit strange that this virus would be detected only after renguard is starting up and at no other point in my computer running... This started just yesterday and i have made no changes to my firewall or Norton. I have restarted my computer and reinstalled renguard with the same thing happening after i did both.

[View Forum Message](#) <> [Reply to Message](#)

My norton antivirus has detected this and its says it found a hacktool.rootkit in windows/system32/SVKP.sys and it only happens when i try and run renegade through renguard, i uninstalled it and i can stil play ren without renguard, i reinstalled renguard and it still doesn't work, i stil get the same error message and a box "loader cannot initiliaze loader (or service don't remeber which one)" its definately not my firewall for two reasons, a i haven't changed anything, and b its an external firewall protecting my home network so it isn't even on this comp. I also tried reinstalling renegade and found that its a renguard problem, and only happens when i try and use renguard.

I'd appreciate it if someone from the renguard team or anyone could help me with this problem.

[View Forum Message](#) <> [Reply to Message](#)

I'm not sure exactly why we're seeing this so often recently. My guess is that the most recent virus definitions file that Symantec put out for Norton's Anti-Virus doesn't like SVKP, which is a service necessary to run RenGuard...

In any case, you should first scan your computer to make sure that you do not have any viruses. When you are confident that you have no viruses, you can then tell Norton's AntiVirus to remove SVKP.sys from the Quarantine list. I will detail the instructions for that shortly, for Norton's Anti-Virus 2005. If SVKP.sys is not in your Quarantine list, then you must reinstall RenGuard (and you can probably thank Symantec for that).

To remove SVKP.sys from your Quarantine list, double-click on the Norton's Anti-Virus icon in your system tray (next to your clock). When NAV has finished loading, on the left you should see a links. I have "Status", "Scan for Viruses", "Reports", and "Advanced Tools". You should click on "Reports". Then, in the top center of the window should be an item named "View Quarantined Items". Click on that. This will bring up a new window showing exactly what files Norton's Anti-Virus has quarantined. Look for an entry with a file named "SVKP.sys" with a threat named "Hacktool.rootkit". Right click, and select "Restore".

If all goes well, then Norton's Anti-Virus should not complain about SVKP.sys anymore (unless Symantec does this again).

And again, RenGuard is not a worm, a virus, a backdoor, or any other malware. I can personally guarantee that.

Edit:

If the RenGuard loader still couldn't initialize the service after removing SVKP.sys from your Quarantine list, then you will most likely need to reinstall SVKP.sys (which can be done by reinstalling RenGuard).

[View Forum Message](#) <> [Reply to Message](#)

Ok..I have already done the same thing and removed it, i have reinstalled renguard and restarted my computer the detection of virus warning STILL COMES UP and now i CAN'T EVEN PLAY THE GAME JUST LIKE RC22FIRES . Before that it would just come up i click OK twice and the game plays with renguard. Now, i get: "Error:Loader couldn't initialize service!" i click ok and im back in GSA lobby. Wonderful, now i will probably get forced from each server i attempt to play because i will be playing without renguard. Another problem that has started after this problem with a virus that is detected when i start renguard is that whenever i click the desktop icon of renguard it brings up a message saying "About to restart." My computer then restarts and before logging into my account on Windows XP it stops at welcome and brings up the installer for renegade demo! So, i can't play from GSA with renguard and i can't get to renegade to play westwood online. Before we just say its Norton lets look over all the possible problems...suggestion maybe Renguard, dunno just puttin it out there

It's Norton - they released their latest liveupdate definitions this morning - we downloaded them like good boys and girls and here we are. I have just spent ten minutes on their site trying to find somewhere to leave a Q for their support staff - remarkably there is no where to do this that I can find. I am not a techy in any way and have no solution to offer - just the reassurance that it is not renguard causing a problem rather Norton - IMHO - it is too coincidental for it not to be. Gulp! I can play just by clicking the game2.exe file - but obviously without renguard - so I am snookered for all but the server I pay for. However one of the ways we police the server is to !forcerg peeps - hence we are a bit exposed to accusations of hypocrisy if all the clan play with no renguard etc. Bit of a conundrum really. BHS have not caused this and it is a Norton caused issue and yet how to contact Norton to get them to undo the damage? Any helpful suggestions would be gratefully received. None of the fixes above work BTW - I have tried them all and get the error:failed to initialise loader error all the time. Damn - just as the weekend is coming up as well.

I quarantined it and everything seems to work fine. When I start RG it still gives the "you have a virus" message, but when I look into the location of the file I find that it isn't actually there, but rather still quarantined. After that everything works normally.

Posted by [-TG-Lammy](#) on Thu, 20 Oct 2005 23:01:02 GMT

[View Forum Message](#) <> [Reply to Message](#)

The solution of the problem is simple!

1.Deinstal Renguard

2.Go to Registry Editor (Start > Run > Regedit)

Search for "SVKP" and delete the folder!

(HKEY_LOCAL_MACHINE\SYSTEM\Contralset001\Service\SVKP)

3.reboot your PC

4.Start Norton

afterwards " Mauelle Prüfung" and "Ausschlüsse"

Then on "NEW" and "c:Windows/system32" and presses on "OK "

5. Install Renguard

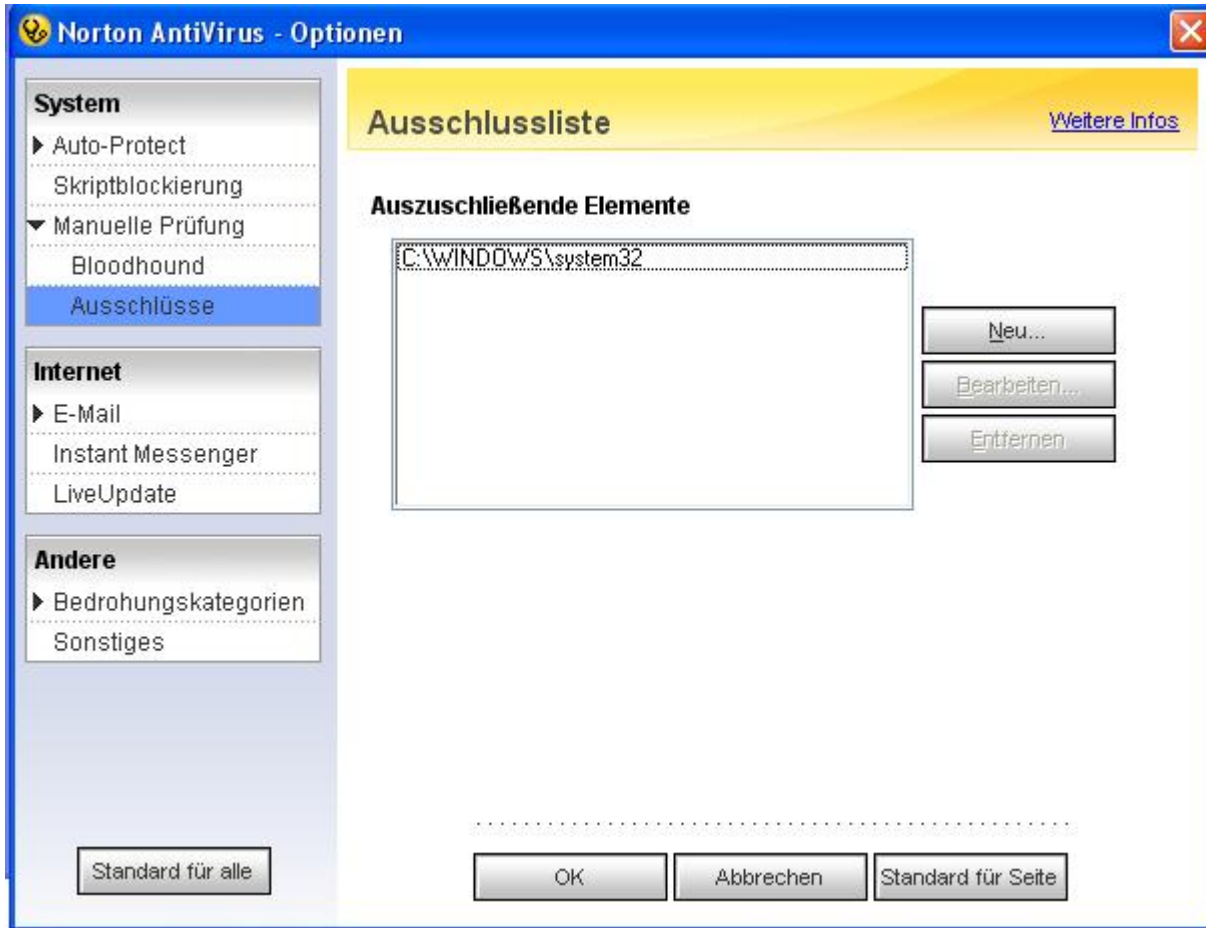

You can start it now without problems!

Posted by [-TG-Lammy](#) on Thu, 20 Oct 2005 23:14:36 GMT
[View Forum Message](#) <> [Reply to Message](#)

Afterwards can you the entry (c.windows/system32)delete!

Afterwards ersaetzt you the entry by exactly the file c:windows/system32/SVKP.sys !

That cannot be done before!

Then leave norton only this file out!

better so!

SVKP is a protection software that makes things harder to reverse engineer. A great idea for RenGuard, but also a great idea for virus writers who want to hide their code. So, because some virus writers use SVKP, Norton (stupidly) marked this as a virus, even though it's not and never was.

I hope you can all get your Norton fixed not to detect this.

Subject: Renguard-related virus
Posted by [\[NE\]Shockwave\[HS\]](#) on Fri, 21 Oct 2005 03:40:39 GMT
[View Forum Message](#) <> [Reply to Message](#)

Ok, I've been playing Renegade for quite a while using Renguard without any major incidents....until now. I'm just going to load up GSA and find a server like usual, except I get an error message along with my Norton Internet Security that I have a virus on my system. I've attached the picture of the error message to this. Now I thought at first that this might be affecting everything. But when I tried to access other programs like Internet Explorer, other games i play online, or just even other crap, NOTHING happens. This only occurs when I try to access the Renguard network. Also, I attached a picture of what Norton says this virus is supposed to do.

What it's supposed to do throws me off a little. Who would take the time to find a way to block me out of Renguard? I'm not a huge tech person, so I don't really know all of the possibilities on what could've happened. My guess (which is completely without evidence) is that someone who has played Renegade with me before doesn't like me...and just decided to send me a present to be an asshole. Like I said, I don't know. Hopefully you guys may know something I don't. Anything at all will be helpful. I will exhaust every possible option before I'm forced to do a system restore. If there's some way you can track something through the Renguard network like this, you guys would be the ones to ask.

[View Forum Message](#) <> [Reply to Message](#)

Well, I've uninstalled RenGuard and excluded the SVKP file in Norton Anti-Virus. But that was after I had already quarantined the file and then deleted it from quarantine. And now it still won't work. I get the GameSpy error message, but not the Norton one, which is a start I guess. I still have the RenGuard installer and I've tried reinstalling it multiple times. But the SVKP file never shows up in my system32 file.

Subject: Re: Renguard/Norton Problems
Posted by [Blazer](#) on Sat, 22 Oct 2005 13:26:50 GMT
[View Forum Message](#) <> [Reply to Message](#)

Nobody is getting "infected". Norton has simply added SVKP to their list of antivirus definitions, most probably because some real virus or worm they found was packed with SVKP. So everyone using NAV who updates their definitions seems to be "suddenly infected". SVKP has been part of RenGuard all along, and is nothing bad.

SVKP is a protection that RenGuard uses, it basically encrypts renguard so that people cannot easily hex edit it or use debuggers on it and otherwise reverse engineer it so they can bypass it.

Sadly apparently someone used SVKP to protect some malicious program that Norton analyzed, so instead of fingerprinting that specific worm, they added svkp.sys to their blacklist...pretty silly but ah well what can we do.

Again, I say, SVKP is NOT a worm, virus, trojan, or anything bad. It is part of RenGuards protection. BHS paid money for SVKP. It is protection software, not a "hacker tool" or backdoor program.

If you remove svkp.sys, RenGuard will cease to function. The recommended way to get around this "problem" is to, as posted, remove svkp.sys from the norton quarantine list. Another option is to not use Norton, but for all we know Norton shares their virus definitions with others and svkp

will show up soon for other antivirus programs.

This isn't really a big deal, the important things are that svkp.sys is not anything malicious, and all antivirus programs have a way to add programs to a "whitelist", so you don't get constant warnings.

ok if i am readin this correctly - norton is causin this hacktool thing thru svkp - an ya'all are suggestin that we allow it by forcin nortons to ignore it - hmm

now my question is - what about the actual viruses or worms or what ever that are usin svkp - if we allow it then we might as well as throw all our anti virus programs away and let the infections begin

so what am i supposed to do

i wont throw my antivirus away nor will i force it to allow svkp. this seams like a problem that you guys need to address and repair versus puttin your hands over your eyes and sayin to ignore it

i trust your program - its a pain at times but very functional and i commend you all on it - but i am forced to not use RG till YOU fix it

bummer too - i really liked it

thanks alot for everything and good luck on this one

gny

Alright: Norton AntiVirus just complained about SVKP.sys for a second time on my machine (eg, after I had solved the problem locally), so it seems like this isn't going to go away easily. First up: Go complain about this problem to Symantec. They caused the problem.

[https://secure1.symantec.com/discuss/support/feedback2.nsf/p roduct+feedback](https://secure1.symantec.com/discuss/support/feedback2.nsf/p%20roduct+feedback)

Now that that's said, let's get RenGuard working again. That is, working until Norton AntiVirus decides to fuck it up again. My instructions will be very specific, so if you fuck up, it's your fault. Also, these instructions will require two reboots.

1) Let's add SVKP.sys to Norton two exclusions lists.

1a) Open Norton AntiVirus.

1b) Click on "Options" at the top of the window

1c) On the left, under "System", click on "Manual Scan"

1d) Two items will appear under "Manual Scan", click on "Exclusions"

1e) On the right, click "New"

1f) Type in "C:\WINDOWS\system32\SVKP.sys"

1g) Click "OK"

1h) Click "OK"

1i) Click "Options" again

1j) On the left, click on "Threat Categories"

1k) Two items appear, click on "Exclusions"

1l) On the right, click "New"

1m) Type in "C:\WINDOWS\system32\SVKP.sys"

1n) Click "OK"

1o) Click "OK"

2) Now that SVKP has been added to Norton AntiVirus's exclusion lists, we'll need to make sure that it's also not in the Quarantine list.

2a) On the left (Norton AntiVirus should still be open... if not, open it again you silly!), click on "Reports"

2b) In the top center, click on "View Quarantined Items"

2c) Look for an item in the list with a file name of "SVKP.sys" and a threat name of "Hacktool.rootkit" (or something very similar)

2d) If you find an item in the Quarantine list which matches the description, then right click it and select "Restore"

2e) When you're finished (or if you did not find anything in the Quarantine list that matches the description), close the Quarantine list, and close Norton AntiVirus.

3) Because Norton AntiVirus is a piece of shit, you will now need to reboot your machine for the exclusions to take affect. So, reboot. This tutorial will be here when you get back.

4) Uninstall RenGuard and SVKP

4a) Use RenGuard's installer -- if you do not have it, then re-download it from www.renguard.com!

4b) Click Start -> Run and type in "regedit" to open Registry Edit.

- 4c) Remove the registry key
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\SVKP.
- 4d) Remove the registry key
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Enum\Root\LEGACY_SVKP.
- 4e) Close RegEdit
- 5) Reinstall RenGuard (which will also reinstall SVKP)
- 6) Reboot your machine

If you did everything correctly, RenGuard should now work. CorePatch 1 will be redownloaded, even if you already have it installed... silly RenGuard can't see that the files are already from CorePatch 1. Downloading and installing CorePatch 1 again will not hurt anything. If you do not want to wait for CorePatch 1 to download, then you can disable it from RenGuard's options window.

Also remember that when installing CorePatch 1, the error 17 at the end is fine.

Norton AntiVirus should NOT disable LEGITIMATE services to disable viruses! That is just plain STUPID. It would be like not using Windows because a specific virus only runs on it! That's stupid. If you're not going to use Windows, make it for a halfway-decent reason: you don't trust Microsoft, you can't afford Windows, someone gave you something else, etc etc. Disabling LEGITIMATE services to disable viruses makes it so that people who payed real money for the service are then not able to use the service they paid for! BlackHand Studios payed for SVKP to help protect it from crackers. Now Norton AntiVirus is making RenGuard useless without solving the problem that RenGuard does solve. Norton AntiVirus is hurting the C&C Renegade community, a legitimate game-playing community with people whom have paid money for the game, the gameservers, the anti-cheat services (some of us), and (many of us) have spent a lot of time for the community as a whole.

hmm
Yes.

HTGunny wrote on Sat, 22 October 2005 12:27

now my question is - what about the actual viruses or worms or what ever that are usin svkp - if we allow it then we might as well as throw all our anti virus programs away and let the infections begin

Norton is detecting svkp.sys as "Hacktool.rootkit", which is just a generic classification of "we think this is a tool that hackers might use". It is more of an informational/caution message than an actual virus hit. What I mean to say is, by telling Norton to ignore svkp.sys, you are not making yourself vulnerable to viruses or trojans that use svkp, because Norton would fingerprint that specific virus, and there would be a special definition for it like "rootkit.w32SomeTrojan".

Antivirus scanners mostly work off of "fingerprints", which are CRC/checksums of parts of files. If a real virus was released that used svkp, Norton would not rely on just finding svkp.sys to detect it, it would have a fingerprint of the main virus executable itself, so you would still be protected.

HTGunny wrote on Sat, 22 October 2005 12:27

so what am i supposed to do

i wont throw my antivirus away nor will i force it to allow svkp. this seams like a problem that you guys need to address and repair versus puttin your hands over your eyes and sayin to ignore it. It depends on if you want to be a sheep and go along with Nortons idiotic claim that anything that uses SVKP is bad. That's like saying a C compiler is bad, because virus and trojans are compiled with one "Detected Microsoft Visual Studio.Hacktool.rootkit!". We paid money to license SVKP because it's the best at what it does. If we use some other protection, who is to say that Norton won't add it too (and maybe already has). I think its easy to see that Symantec/Norton are the ones who have overstepped their bounds here, and while I would like to think that we could talk to their support people and have the definition removed, I doubt it, so that means the only course of action that can be taken is by you

HTGunny wrote on Sat, 22 October 2005 12:27i trust your program - its a pain at times but very functional and i commend you all on it - but i am forced to not use RG till YOU fix it As I said, there is nothing *we* can fix. The only way that we could try to fix it, is to not use SVKP, or any other sort of protection in the next version of RenGuard. Sadly, if we did that, RenGuard would get hacked in about 30 seconds from release. I don't really have time to explain in detail, but suffice to say that RenGuard without SVKP or something similar, would be like RenGuard being a renguard.txt, with one line that says "hacked=false", that someone could just edit to say "hacked=true".

HTGunny wrote on Sat, 22 October 2005 12:27

bummer too - i really liked it

thanks alot for everything and good luck on this one

I understand your frustration and believe me, nobody is more frustrated than us. We will continue to try to find the easiest solution, but in the meantime we recommend making Norton ignore

svkp.sys. We would not make this recommendation if we thought it would expose your PC to other harms.

quote by: -TG-LammyQuote:The solution of the problem is simple!

1.Deinstal Renguard

2.Go to Registry Editor (Start > Run > Regedit)
Search for "SVKP" and delete the folder!
(HKEY_LOCAL_MACHINE\SYSTEM\Contralset001\Service\SVKP)

3.reboot your PC

After that i Reinstalled Renguard with norton disabled.

This worked for me, i just started having the problem after Norton autoupdated.

I also Put the file in the exclusion list and i have no more problems.

I disabled core updates for now.

This sounds like a different problem than the current one, so idk...

However, the svkp.sys issue does seem to be the fault of Symantec...they should be able to scan into svkp protected files in the first place...

Are you sure nobody is getting infected? When I got this norton problem what i did was highlight svkp and all it said was "svkp.sys"

When I deleted it and replaced it with a good copy I got what I should have:

Description: SVKP Driver for NT

Company: AntiCracking

FileVersion: 4.0.1341.1

Size: 2.31 KB

The first file was of a different size too. It was corrupted. I know a few people with Norton who has not got the problem.

Also I have not updated my virus deffinitions in a long time and they don't just update themselves. So I do expect it was a virus going around somehow.

I have a fresh svkp. Reformating is NOT the answer.

If you have this problem still email me or msg me and I will help you find the solution.

rc22fires@hotmail.com : For msn messenger and primary email.

rc22fires@yahoo.com : Yahoo messenger.

rc22fires : AIM.

I have already got 3 people back on Renguard.

My svkp.sys WAS infected. I could not delete it due to write protection. Its size was more than it should have been. It WAS an infected version.

People who have gotten the infected version are the ones who got the Error: failed to initialize service! when trying to start RG.

Norton has added it to its bad list because of that virus that was going around.

Norton gives you the virus found message even after you have deleted or quarantined the svkp.sys file when starting RG because RG uses the svkp.sys and Norton detects that svkp.sys and RG work off eachother to infect your computer.

I have replaced my svkp.sys to get RG working. I got rid of Norton so I don't have to deal with its messages because I personally don't like putting a file used for viruses on a ignore list.

Please try this working AntiVirus freeware if you don't want Norton but don't have any idea what you would get instead.

<http://free-av.com/>

Please if you have gotten rid of the Norton problem and you are stuck with Error: failed to initialize server! message when starting RG just:

1. Uninstall RG.
2. Put in a clean svkp.sys to c:\windows\system32(attached)
3. Restart computer.
4. Innstall RG.
5. The core update sometimes fails to download and install itself. Download it from <http://www.blackhand-studios.org>

Also you would wan't the svkp.sys if you have deleted the other one even if your copy wasn't infected as some were.

Well best of luck to all getting back on RG.

EDIT: Deleted svkp.sys attachment, as I already attached mine several posts ago in this same thread, and I cannot be certain of the integrity of yours. -Blazer

Excuse my french, but NO SHIT! As I have been saying SVKP is part of Renguard, BHS has a paid license for SVKP. It is an integral part of RG's protection.

I wish everyone would stop trying to "uninstall" SVKP, thinking it's something bad, or looking for a "clean" copy. SVKP is not infected, it is simply added to Nortons list of "hacker tools" because some script kiddies use the same protection on their viruses/trojans.

FYI, I have just sent this message to Symantec:

Blazer

I work for a nonprofit company that provides legacy support for a particular game title. One of our products is an anti-cheat addon, which utilizes the "SVKP Protector" to encrypt and protect our code from crackers.

In effect, every game client (thousands) are using our module, which utilizes SVKP.

The problem is that as of last week, Symantec added SVKP to their virus definitions as "Hacktool.Rootkit".

This is causing *major* disruption of our customers who use Symantec security products, as their game clients no longer work, and we are being flooded with support issues as the average joe user just sees a popup that they are "infected" and want to know why our software is a virus or trojan.

Please reply ASAP and let me know the procedure for requesting removal or alteration of a virus definition, or at least it's description page (http://securityresponse.symantec.com/avcenter/venc/data/hack_tool.rootkit.html), to include information to the effect of that just because a program is using SVKP, doesn't mean its a backdoor/trojan/rootkit.

Our company pays a licensing fee to use SVKP, and Symantec has pretty much pulled the rug out from under us....please advise.

ok in an effort to smooth things over between clans... mostly under pressure from the clan to comply... I will make 1 civil post on this issue and then consider it dropped.

My problem is not with your using the tool, its not taking action to eliminate the need for a tool that is being used by numerous worms and viruses out there to launch their attacks. AND telling people to just allow it to work ignoring the virus warning. New viruses are NOT caught in time by anti-virus companies all the time. So by white listing a blocked tool you put yourself at a higher risk then is recommended. Just to use your program. In my particular case I can not use it anyway, because I use windows 2000, but that's another issue.

According to a message I received from AntiCracking@AntiCracking.sk the golden support customer base are able to receive an updated method for embedding their protection into their compiled executable. all you have to do is request a support ticket on the matter.

This is a computer safety issue, not a renguard issue.
according to symantec here <http://securityresponse.symantec.com/avcenter/venc/data/w32.spybot.ubh.html> the file "Creates the file %System%\SVKP.sys. This is used by the worm to unpack itself and execute" this is one of many worms currently using this method. Thats is why all of them are now adding it to their list of blocked signatures.

Thus it is a vulnerability that should not be used if at all possible. the developers are aware of its current abuse and are taking stems to secure the method through other means. but at this time its a vulnerability, most. including myself, are not willing to risk using just for a 3rd party anti-cheating program.

A similar problem is also hitting punkbuster, so there is no need to feel singled out. This is what they do. In any case. This is my last posting to your forums. I have no desire to continue the flame war between clans forums. I will instruct our members that upon a single complaint of continued flaming we will suspend them from HT clan for some predetermined period. I too will be suspended for a short time as a council member over this issue. This is an effort to repair any misgivings between clans and to end the PMs and flame posting...

thank you,

=HT=Ingram
HazTeam Council.

ingram091 wrote on Mon, 24 October 2005 06:52

My problem is not with your using the tool, its not taking action to eliminate the need for a tool that is being used by numerous worms and viruses out there to launch their attacks. AND telling people to just allow it to work ignoring the virus warning.

Firstly, we cannot "eliminate the need for" the tool. If RG is not encrypted, there would be cracked copies of it out within 24 hours, and people would even be poking around it with a hex editor. And I would like to point out, that there has been no "virus warning". The alert the Symantec/Norton gives, if you actually take the time to read it, is that svkp.sys is not a virus itself, but rather may be part of or indication of another virus or trojan. To be honest, I have never heard or actually seen SVKP used for an actual virus, most script kiddies use UPX and other free exe wrappers.

ingram091 wrote on Mon, 24 October 2005 06:52

New viruses are NOT caught in time by anti-virus companies all the time. So by white listing a

blocked tool you put yourself at a higher risk than is recommended. Just to use your program. As I said, blacklisting SVKP is about as silly as blacklisting Visual C++, since after all, they can both be used to create or part of a virus. If it's possible, I would recommend some combination of settings such that svkp.sys is ignored, except if something tries to overwrite it.

ingram091 wrote on Mon, 24 October 2005 06:52

According to a message I received from AntiCracking@AntiCracking.sk the golden support customer base are able to receive an updated method for embedding their protection into their compiled executable. All you have to do is request a support ticket on the matter.

SVKP is a kernel mode ring-0 driver, and you cannot simply embed it into an executable. They do have lesser forms of protection that are not ring0 and can be embedded, but they can also be bypassed with ease, which is why we use the more elaborate solution.

ingram091 wrote on Mon, 24 October 2005 06:52

This is a computer safety issue, not a renguard issue.

According to Symantec here <http://securityresponse.symantec.com/avcenter/venc/data/w32.spybot.ubh.html> the file "Creates the file %System%\SVKP.sys. This is used by the worm to unpack itself and execute" this is one of many worms currently using this method. That's why

all of them are now adding it to their list of blocked signatures.

That particular worm not only creates an SVKP.sys, it also exploits a bug in Windows PNP (which has long since been fixed), and connects to an IRC network. For to get infected by that worm, they would have to have a non-updated Windows installation, the virus infection, and no firewall whatsoever (or at least one that wouldn't stop or popup on the outgoing IRC connection). If they meet any of those criteria, I doubt blacklisting svkp will make them any more secure.

ingram091 wrote on Mon, 24 October 2005 06:52

Thus it is a vulnerability that should not be used if at all possible. The developers are aware of its current abuse and are taking steps to secure the method through other means. But at this time it's a vulnerability, most, including myself, are not willing to risk using just for a 3rd party anti-cheating program.

Until I hear of a significant number of cases where an actual virus uses SVKP, I would not be concerned at all about whitelisting SVKP.sys. The very URL you provided as "proof", shows that the number of reported infections were "0-49"...I bet it was a lot closer to 0 (like a single report), than it was to 49.

Despite my views, I do recognize that it's your computer and you are entitled to be a paranoid as you want. Just know that we are very aware of the issue and are taking steps to do what we can, including considering a different protection software for RG 1.04, and accelerating the development of RG 1.04.

trashyall wrote on Mon, 24 October 2005 07:17 Hey it worked!!!

My only concern would be any other virus that uses this SVKP file?

Thanks for your help, sure glad soe of you know whats up so we can continue to enjoy playing Renegade!!!!

There has been a very isolated report to Symantic of a virus that used SVKP.sys. For all we know it is the very incident that caused them to put SVKP.sys on their blacklist. The strange thing is it's not often that anti-v companies add a *file name* to their blacklist, usually the fingerprint specific virii and detect them that way.

So, to answer your question, will blocking SVKP.sys stop any viruses that may use SVKP? Yes.

But also consider, that SVKP itself is not a "hacker tool", or a virus, or a trojan. It is the kernel mode driver part of the SVK Protection software, so basically, just because you have an SVKP.sys, doesn't mean you have a virus.

Think of it this way. Your car has blinking red lights to alert you of problems. So, does making sure there are no blinking red lights mean that your car is fine? Yes, but also just becauser there is a blinking light, doesn't mean it's something bad (alarm system?). So instead of making sure there are no blinking lights in your car, you consciously ignore the alarm system blinking light, because you know it's harmless. Same for SVKP.sys. If there was a real virus that used SVKP.sys, there would surely be other indications of it via either a direct fingerprint id by your antivirus, or your firewall, etc.

I quite agree. Unless Symantec can prove SVKP not only can... but does cause harm to your

computer, they should refund BHS (and all other of SVKP's clients) money, plus damages, plus public relations costs, etc etc.

[View Forum Message](#) <> [Reply to Message](#)

If you follow Kanezor's instructions at the bottom of page two in this post, Renguard will once again work!! Even if you can't remove the
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Enum\Root\LEGACY_SVKP. I was having the same problem w/Norton... I'm glad I read this though.

I would add one more step though. Norton Antivirus has an "Auto Protect" feature. You must put the SVKP file under the exclusions list for this feature as well, or when you start renguard again, the auto protect will kick in, and you'll get that same message.

Anyways, I'm glad Renguard is working again. I was in a game today, and it was 2vs1, and I was kickin some butt on hourglass, and they kept "Iforcerg" me. I hate cheaters, and just because you're getting owned doesn't mean someone cheats... Thanx Kanezor!

Aha! That must be why RenGuard only works once for me after following my instructions (and then need to do my instructions again to work once more). Cool. Now I can use 1.03 again! Yayayayaya!!!

Edit:

If you are still having trouble with SVKP, please follow the instructions at the link below!
http://www.renegadewiki.com/index.php?title=RenGuard_SVKP_Is_sue#Alternate_solution

Would someone mind letting me know if a reboot is necessary at all? It may be just that I was missing that "Auto-Protect" exclusions list...

The "fix" is pretty much out of our control...what if we switch to using "LeetProtect 6.9" instead of
SVKP, and the week after release Norton and others decide to add it to their blacklist as well? So
you see there is no real solution other than for the user to be educated and know the difference
between a real virus and somethign that is just arbitrarily added to a list of "things that might be
bad" bit antivirus companies.

No one from BHS is telling you to uninstall your anti-virus. We are just asking you to tell Norton to ignore SVKP.sys because it's falsely detecting it as a virus. RenGuard has been through the hands of over 15,000 people and until this Norton update, no one has ever found one bit of suspect activity. Furthermore we invite anyone to find any sort of hacktool/rootkit code in SVKP.SYS.
