I want to know if there is a script that does this.

A script that is attached to an Object. And when that object is destroyed it Destroys or disables a Building controller.

Thanks

Should be what you want somewhere, I dont have time to look for the right combination of scripts right now.

Ok Thanks.

I am trying to make a M03 serverside map and i'm having a problem with the controllers. The multiplayer Ref controller does not work with that Refinery and the single player Reg controller causes Renegade to crash when you use K.

Does anyone know how i could fix either of those.

The reason why I wanted that one specific script was so i could have it so when you take out the Powerplant. It destroys the Obelisk controller which will than end the game.

Hold AltShift and hit + to View more Although your select distance will remain the same. Hold Alt - To decrease.

i guess your mp building controller didn't work because the mesh prefix is a different as the mesh prefix of the sp building controller. try to change it or to make a new mp controller with different prefix. to your scripts question: try to use jfw_death_send_custom and jfw_custom_destroy_building to kill the building controller.

Thank you. I did try changing the prefix though. I think the reason why that does not work is because its Serverside.

And I will have to look more into custom scripts because I never got them working before.
