CNC Den News ArticleImproving Renegade's Performance

Sunday - June 18, 2006 (08:41 AM) by Lion

Renegade

For those of you who continue to play C&C Renegade, you might want to check out <http://www.understorm.net/rend3d9/> that offers the 'RenD3D9 Project' to help improve your gaming experience.

The RenD3D9 project makes C&C Renegade use Direct3D 9.0c instead of Direct3D 8.1. And adds certain optimizations to gain extra FPS and faster loading times on certain NVidia cards. Also comes with a new wwconfig to configure the additional features.

Check the <http://www.understorm.net/rend3d9/> for more info and the download.

Supported Hardware:

Certain Intel hardware is supported aswell, let me know if they work out for you.

- \* ATI Radeon 8000 series
- \* ATI Radeon 9000 series
- \* ATI Radeon X000 series
- \* ATI Radeon X1000 series
- \* NVIDIA GeForce 4 series
- \* NVIDIA GeForce FX series
- \* NVIDIA GeForce PCX series
- \* NVIDIA GeForce 6 series
- \* NVIDIA GeForce 7 series

I tested this patch out for a bit on my XFX GeForce FX5200. With Anti Aliasing 4x and Antistropic Filtering 8x enabled I got 130 FPS.

Before I installed the patch I used to only get 80 FPS with Anti Aliasing and Antistropic Filtering disabled.

So a worthy patch to have installed. I did not, however, test it during online play.

that's awesome...

it would be even cooler if DX9 features were implemented, like better lighting and shadows. if that happened I would start playing again (not that graphics are better than gameplay, it would just be a new experience).

I tried it with my GeForce 7300GS and it removed all the text and my cursor from the screen.. I'll try installing the version of DirectX that was linked to but I already have 9.0c..  
Edit: It will only work in windowed mode for me..  
And what kind of changes would I be able to see? I have everything set at the highest level normally so I don't see much of a difference.. :S

Did you check to see if your card was one of the supported cards on the list?

Quote:will this work on the FX5200 PCI cards too, or just AGP/PCI-e?

It works on either AGP or PCI versions of each of the supported cards.

Don't download this if you're card does not use DirectX 9.0c. You'll get worse performance than before (atleast that's how it should work if the engine uses newer technology).

Wouldn't this also benefit ATI cards as well?

Right... how can i uninstall this since it has worsend it down to 12 FPS?

The card is: NVIDIA GeForce FX 5200 running "nv4\_disp.dll" as its main driver.

EDIT: its ok, i uninstalled it by deleting the two files (.exe and .dll)

Umm... I'm guessing the GeForce 7300 is included in the NVIDIA GeForce 7 series so I'm pretty sure that it's supported..  
I like playing in windowed mode anyways, finally I'm able to use VSync while playing windowed mode(my renegade freaks out when it gets over 90 fps so I use VSync to keep it stable) so that's pretty cool.

Vertical Synchronization is an option found in many games that allows the frame rate of the game to be matched to the refresh rate of the monitor. Generally, allowing VSync provides the greatest stability, but turning it off can allow for much higher frame rates.

This just raised my average frame rate up by 5 to 10 frames. I like it so far, but if I see any adverse side to this its good we can just switch back. I mean I can live with 45 frames in a 40 player game while running outside. Not that big of a deal with me but it does help. Thanks Scorpio.

Most people don't even notice, but it bugs the crap out of me if it's off. By tearing I mean you actually see lines across the screen between frames. it's kind of hard to describe, you have to see it. I don't know why almost everyone doesn't even notice, but I see it so easily.

Quote:Dang this thing even fixed my generals. My water would always flash on any maps or menus and after this little patch its perfect now.

Question though, generals is the renegade engine but shouldnt this patch be directed tword renegade only?

I don't know much of anything about DirectX or Direct3D, but maybe since Generals and Renegade use the same engine, the programs share similar functions, in which this patch can use [DllImport] and [DllExport] functions to access them. For example:

Generals contains some FunctionX(); and Renegade contains the same some FunctionX(); The patch uses [DllImport] and [DllExport] to retrieve those functions and has the same produced

effect on each.

I don't know if that makes any sense, but it's just a thought. (I use a similar method to retrieve functions from two separate Windows Forms in my applications)

Tis

There is tremendous evidence that it is the renegade engine with just updates to graphic points like shadowing and lighting.

Im not saying its a TC or something like that but it uses W3D (Same exact one as Renegade, header is at the end of file instead of the beginning) might be visa-versa

Uses RenX to model and bone.  
All objects are boned the same way as renegade.  
Maps use heightfield (Enhanced of course)

It is the renegade engine, just in a different shell.

Other Note:

Generals is DX8-based and it's simply a port of the W3D Engine to a rts-variant, named SAGE. This should work there too.

It shouldn't be used on any cards that don't default to DX9. Old PCI cards would most likely fall into that catagory.

My card is PCI and it supports DirectX 9c and OpenGL 1.5. It doesn't get that great of performance on newer games but it runs most of them fine for me.

And there were instructions on how to install the patch on there website just a tad further down from the download link.

Quote:How to install:

Download and unzip the latest build of RenD3D9 and extract the contents in to your Renegade game directory.

After you installed RenD3D9 launch wwconfig2.exe (located in your renegade directory) to configure the new features.

To be able to run RenD3D9 make sure to install the DirectX 9.0c June 2006 release.

Might install Ren again to try this out. Even with a 6800GS my FPS was never exceptional (70-80) but it'll be interesting to see how this works. On my old Radeon there was a DX option to unlimit the FPS and I got about 300 on the menu screen but I can't remember what it was.

As for Vsync, it basically synchronizes the FPS with the screen refresh rate which somebody has already said. A CRT draws the screen with a single point/dot spanning the screen from top to bottom really fast (refresh rate speed), drawing each dot/pixel in horizontal lines and Vsync allows it to keep up. Atleast that's how I think it works. I dunno about TFTs. Do you get ripping on them? I'm guessing you do but the screen must draw differently.

Yeah, you get ripping on LCD monitors.

Don't expect a performance boost, sanada. I have a 6800 and the only thing that goes faster is the loading screen. This is better for people who have somewhere around the FX series and the ATi 9000 series.

I get 700+ fps when on the loading screen and 100+ fps on the menus. There isn't much difference when on Online play. Its an old Mobility Radeon 9200, so I can't squeeze too much out of it.

---

Subject: Re: Increase Renegades performance.  
Posted by [danpaul88](#) on Wed, 21 Jun 2006 09:34:33 GMT  
[View Forum Message](#) <> [Reply to Message](#)

---

Certainly looks nicer, no real fps change (still a steady 75), but I had all the effects on full, using a radeon 9800se, and there are some nice effects ingame...

One problem... it causes renguard to crash on loading.. why is this? Renegade loads normally if you start it using game2.exe, but if you load renguard it crashes.... if this is not going to be compatible with rg I will have to remove it again..

Remember though, this patch is still in its early stages of developement considering it is fairly new. Over time I sure the bugs will get worked out.

Quote:I actually think this should be stickied.

That would be a good idea. It would benefit not only members of this forum who don't visit often,

---

(so may never see this topic), and it would benefit new members as well.

Hit the Windows Key, (found between the CTRL and ALT keys) always works to minimise for me.

---

oh, ok

\*goes to try without vsync\*

well fps goes up to 120+, 150 when looking at animated objects (wierd how it goes HIGHER when theres more processing to do... but meh.. not complaining )

Oh, and I agree with your siggy, TA Spring is great

EDIT: oh, and minimising with the windows key has the same effect, when you try to reopen the renegade window it crashes

Dead Dave wrote on Mon, 19 June 2006 06:43I tested this patch out for a bit on my XFX GeForce FX5200. With Anti Aliasing 4x and Antistropic Filtering 8x enabled I got 130 FPS.

Before I installed the patch I used to only get 80 FPS with Anti Aliasing and Antistropic Filtering disabled.OMFG (I must write it this time)=

I have an Intel Pentium4 with 2,4Ghz / 1GB real good GSkill Ram and the FX5200. And I want to know what kind of CPU do you use? The fps values you've posted are in some Areas of a Nvidia 6600GT!

-----  
To stop those questions about Videocards which are supporting DX9=

Nvidia= Geforce 5 (FX), Geforce 6 and Geforce 7 up to 7900GTX  
ATI= Radeon 9000 series, all X000 series, all X1000series and higher up to X1900XTX (The Radeon 8500 does NOT support DX9), it supports DX8.1!)

So this means, the minimum Hardware is a Radeon 9200 or FX5200. Below, there is ZERO DirectX9 Hardware Support present.

And don't forget, Renegade is coded in DirectX, so a better CPU is more important than a better Videocard. A faster Videocard with more Speed is good for keeping your FPS constanly at the average Level when big rushes will come. A faster CPU will increase the average FPS...

On BF2 or just NFS, it's the same.  
-----

The news about this tool are going through many forums in Germany now since a member from UES posted them.

In my humble opinion, it only can raise the fps by tweaking the graphics driver. This is the same way the DNA- and Omegadrivers tweak the drivers.

www.omegadrivers.net -this will increase the FPS up to 70more (depending on the Videocard).

=====

@nopol10

You mean 700+ in the menu and 100+ ingame. I have had an AMD 3200+, 1GB Corsair Ram and the Nvidia 6600GT. I got in the menu 500+ with the omegadriver and up to 120-130 ingame. I recommend everyone to use the Omegadriver, install it on Quality (because this increases the pure FPS performance also) and look at the console when being ingame.

You can easily overclock the Videocard with this driver. It searches for the safe maximum the Videocard can handle. On my old 6600GT which ran on 500Mhz Core and 1Ghz effective DDR, it set the card to 576/1150...

Is your video card the "NVIDIA" FX5200 or the "XFX" FX 5200?

Quote:I have an Intel Pentium4 with 2,4Ghz / 1GB real good GSkill Ram and the FX5200.

I have an Intel Pentium 4 3Ghz, with 1GB of Corsair XMS Gaming RAM, and the XFX FX 5200.

And you have to take into account, it isn't just the performance ratings of your hardware that matter. There are other factors to take into consideration as well. Your computers health is the biggest part. Things like your hard drive being extremely fragmented, your RAM being fragmented, your hard drive having low memory, having alot of useless processes running, viruses, spyware, malware, adware, ect. There are alot of factors besides hardware that matters.

Also, in a previous post, I said I did not test it during online play, I only tested it in multiplayer practice. I had Vsync disabled as well.

This project is a definate MUST GET for people owning compatible video cards.

I'm actually experiencing the game in full details now whereas I always had to play on the one but lowest performance setting. I still need to find the exact best settings after some testing though.

I personally do not get 700 FPS on the menu screen, but I have seen as high as 550 on my

friends computer. As for proof, you will have to ask the people who stated they got the 700+ FPS or so.

Does anyone know how to provide feedback or submit technical problems to the author of this tool? Have looked at the original site and does not appear to be a easily accessible way of posting/informing him/her/them - mind you i may be being stoopit.

However, the collective genius's here may well be able to help. I have:

AMD 3500+  
2 Gb Ram  
NVidia GeForce 6200 turbocache 256 mb card (cheap i know, but came with system).

Tried the tool but have the following problem. When i start renegade through the Renguard icon, the game "attempts" to load and i get the renegade sound but a blank (black screen). The EA Games splash is not visible,; i click esc to get through the video etc until i arrive at the options

screen. Here is the problem. There is all the relevant imagery but no writing and no visible mouse pointer which means it is impossible to progress the load.

In reaching that point i had updated the Gphx card drivers from the nvidia site. I had downloaded the correct Direct X and installed it. I even went as far as updating my monitor (LG CRT) drivers. I restarted PC. I uninstalled Ren (completely) including several registry flushes to ensure complete eradication of Westwood components etc. Did a complete and fresh install of renegade and checked it worked satisfactorily. I tried all the variables in the WWConfig2.exe - all gave the same result. I removed tech two files and ran renegade and it worked perfectly, but with my standard 75 FPS.

I ran the prog again in windowed mode and got the game to work but only at 30-40 FPS (i set up a single player server for myself). I turned windowed mode off and got same problem - invisible mouse and no writing.

So..... any constructive advice as i would like to try this and see if it gives an improved game experience.

Well actually, 700+ fps is at the screen directly before the map loading screen (joining game dialog box). At the menus, i get 100+ and in the game it drops to 50-70 fps.

And one question, how am I going to reinstall ATI's drivers if OmegaDriver screws up my system. (I haven't installed it yet.)

---

OK, Good news.  
VERY positive results with a:  
Connect 3D Radeon 9550 512 MB.

Can now get 180 FPS on menus and 50 ingame (small servers)

Not bad for a seven year old system. Still tweaking.

If you need to reinstall the ATI drivers simply download the latest one from the ATI site. Then uninstall Radeon Omega Driver from your add/remove programs list and run the executable to install the ATI one.

I doubt you will have any problems with it, I use the Omega drivers and I find that they are much more reliable than the ATI ones. The ATI Tray Tools also have some nice features that I use.

Odd... Omega Driver seems to be doing nothing to my FPS. Am I doing anything wrong?

Oh and in reply to one of the earlier post, the DX9 patch for Renegade does work for notebook versions of the graphics card.

It also works with Red Alert: A Path Beyond (duh.)

Refue11er wrote on Fri, 23 June 2006 04:45 Does anyone know how to provide feedback or submit technical problems to the author of this tool? Have looked at the original site and does not appear to be a easily accessible way of posting/informing him/her/them [...]

so someone knows where to get support ?

i had an error message which said i should go here for support ...

but seems there is no board for this tool so far

i have a problem, after my computer was on for some hours (like 24h or more) i cant start renegade if i use this awesome tool ...

if i want to load the game it crashes to the DT the same moment the game menu appears.

if i reboot my computer renegade works perfect again.

GF 6800

AMD XP64 3200+

latest drivers

latest DX9 (downloaded by the link of the tools main page)

windows xp x64

no renguard

Jeep Rubi wrote on Mon, 26 June 2006 20:28Cant you just live with rebooting your computer before playing Renegade?

no ... i do not want to restart my computer  
and it tooks ages cuz of all the tools i autostart and all the passwords i have to enter ...

and rebooting would just ease the symptoms and not cure the sickness ...

i got it working for 30 min yesterday ... today i tried to play .. it start .. then it crashed .. annoying ..

i played yesterday with AA4x and AF 16x and i saw some improvement, tearing pissed me off so i stay with vsync on. when off got 550-580 fps durin loading and 80-130 ingame, but now .. i cant play with this tweak .. i liked the AA feature but its the only ggod think it made in my pc, no fps boost or anything like that, it will help ppl with middle range pc, like 9200-9500 ati or FX series. i got a 7600GS 512mb and its like before. only sharper when i use AF 16X .. when it dont crash

OKIE, Just to get a few things straight.

This tool WILL work if your graphics card supports DirectX 9.

This tool acheives better frame rates if you DISABLE V-Sync. (easy in ATI's Catalyst Control Center)

This tool acheives better frame rates if AA (Anti-Aliasing) and AF (Anisotrpoic filtering) are ENABLED.

Hope that helps. Also, this is not a cheat of any kind, odd that RG moans at it. anyways.

Isn't. That doesn't mean there won't be any in the future. Actually, there will be more versions, as apparently the real reason why this is being done isn't in the current version.

Anyone know if this works for a Powercolor (in other words Piece of shit) Radeon 9250? I'm not really sure if this would or would not fall under the 9x00 series. And I'm too poor to get a somewhat better card at this time.

---

The Radeon 9250 doesn't have hardware support for DirectX 9.0 if I remember correctly, since it's a slightly faster version of the Radeon 9200 which is a slightly faster version of the Radeon 9000 which is based on the Radeon 8500 core.

Ok users of the cards that get the missing menu or crashing try this one  
<http://renegade-help.com/upload/users/paradox/d3d8.zip> erase the the old files and use that one.  
It works for any directx8 game i suppose.

That only happens to ATi cards. The solution is to disable AA.
