You should see what it is when you export it with XCC Mixer.

If I remember correctly, I thought it was DXT5 with Alpha Blending.

You need to make alpha channels... not sure how this is done but that is what you need to do to make those spots transparent

Just takes a little research.

Alpha Channeling
Alpha Blending

Thats what needs to be done, you need to make the part you dont want to be seen transparent, then fix up the rest.

Theres another way to do it, it takes everything of the specific color and makes it transparent, if something is tinted that color it makes it semi opaque.

Thats called Alpha Channeling, but you need to specify the colour first.

Hey guys, youve got it all wrong, what rubi needs is how to do alpha channels in photoshop(I hope, thats what I edit my hud in). Rubi, heres what you do, you select the area you want transparent, then you go over to the alpha channels tab, and in th main one(black and white)in your selection area fill it with white(white is 100% trasnparent, black is 0% transparent, and everything inbetween on the gray scale are the in between percentages of trasnparency)

If alpha channels in photoshop isnt what you needed then Im sorrtr.
