"Scripts2 not found/not loaded" It happened in level edit, I did as I was told... I created a Scripts folder, and copied scripts.dll and scripts2.dll into it from my renegade folder. I didn't get this error before, but after I installed scripts2.9.2 it started messing up! I tried redownloading but still won't work... help?

if you download jonwill's version of the level edit .exe, you won't even need to create the scripts folder as it will read the scripts.dll and scripts2.dll from your data directory

Well... It isn't only not working for level edit, it isn't working for renegade.

If your going to use scripts.dll 2.9.2 you MUST also have bhs.dll in your renegade folder. Check that you do.

did you rename scripts.dll to scripts2.dll when you installed 2.9.2?

If you did, was there another scripts2.dll that you deleted before renaming scripts.dll? Because if there was then you did it wrong!

? I followed the installation instructions in the readme. I renamed scripts to scripts2 and deleted the original scripts2.

ah-hah! well thats why your having problems

You ONLY rename scripts.dll to scripts2.dll if you dont already HAVE scripts2.dll. You have now deleted your original renegade scripts!

Luckily for you I happen to host a scripts package including the correct scripts2.dll, although its only 2.8 of jonwils scripts (have not updated it recently).

http://www.lmsbc.com/html/downloads.php?cat=2#1

Download 'Scripts.dll 2.8 - Standard Version'

Exract the 3 .dll files to your renegade folder, and you will be ok.

If you then want to install 2.9.2 download that from sourceforge, and extract scripts.dll and bhs.dll into your renegade folder, and do NOT do ANYTHING with the scripts2.dll from the first download

---
