There are two new "communities" offering hosting for renegade servers, as well as other games. rencorner aka neronhosting and [DLoC] clan led by LordESide also [DLoC]LordESide. Both people I would highly advise not renting from and staying away from these people and thier hosting would be a very good idea.

View Forum Message <> Reply to Message

rencorner has already been discussed on this forum, just kind of a secondary note.

[DLoC] falls in the same category as rencorner. Young kid that knows nothing about hosting. Will cause nothing but a problem for the people he hosts. Which will be another host putting of mass servers with tremendous lag, flooding the servers listings with numerous server.

The quicker these kind of people vacate hosting, the better off the community is as a whole.

I aggree.

If you're going to choose a hosting company for Renegade I advide you choose Aohost www.aohost.co.uk .

Lag free server's

On the spot support.

You get what you paid for.

My oppinian.

lmao.. its turnt into an aohost topic!

Quote:Way to plug another hosting company I wouldn't rent from.

any paticular reason?

Quote:i have lag on aohost, the ping is usally 200 when an jellyserver it is 80 and many other servers.

thats probably due to location, although in my server i have a ping of 200-250 and ive never had lag issues?

Quote:Lag free, not really atm for our server...

yeah... thing is with your server is that nobody else on the box is having problems, and the ping/sfps/kbps seem to be fine.. 0.o have you tried fiddleing with the nut?

Subject: Re: anyone looking to rent server PLEASE READ!!!
Posted by cheesesoda on Wed, 27 Sep 2006 21:55:53 GMT
View Forum Message <> Reply to Message

Nightma12any paticular reason?
Then again, I wouldn't buy hosting from any small company that rents from another company. That makes the support so much slower and unreliable. Plus, the price is driven up. Not to mention that it's not really a professional host, so I don't know if I can really trust the staff and their qualifications. There are plenty of other small details, but that gives you an idea.

Subject: Re: anyone looking to rent server PLEASE READ!!!
Posted by Matix on Wed, 27 Sep 2006 23:27:15 GMT
View Forum Message <> Reply to Message

I overload my servers? One of my boxes has 2x more gb then both of nightma's combined. I only run like 4 servers on a dual opteron 4gb ram?? How about nightma, like 20 servers on 2 silly little P4s. both with 1gb. Thats what I call overloading..

Subject: Re: anyone looking to rent server PLEASE READ!!!
Posted by fl00d3d on Wed, 27 Sep 2006 23:29:42 GMT
View Forum Message <> Reply to Message

You have valid points there. But with AOhost you're not paying for "professional" (as you would define it) hosting. AOhosts prices are almost 1-2x less than a "professional" host. Then again, just because someone isn't a 25 year old established geek like myself doesn't mean that they're not qualified either. Like Nightma12. He does one hell of a job for is age. I've been very

impressed. Don't underestimate 'the little guy'

We actualy baught a server off Nightma12, And what I said is true.

When I need support for the server, Nightma give's it to you instantly.

I never have lag on the server, Mabey it's becuase I live were the server is located but meh.

And creepiner the owner of our community hasn't complained about lag.

And we did get what we paid for, A lag free server with any Regulation bot, And any choice of server applications (WOLspy and so on)

I think Nightma's Hosting is Amazing, Best around if you ask me.

Nightma's servers are by far the best I have ever seen. There is little to no lag on them too. Plus nightma just let me host a server on one of his boxes and so far there has been no lag at all. He also helped me set it up right away. Like everyone said he gives the best tech support man can offer and his servers dont lag either.

Not to mention Morphix owns ONE windows box that all games run from, so lets think before you rent from Neron Hosting.

Lets see, EV1 uses Cogent, AboveNet, Savvis and Verio. Two of the above stated are shit. I know you have no idea what I just said, so let me give you some advice.

If you were smart, you'd get a broker to help get a box (Myself, xptek, or somebody with knowlege concerning servers).

You should not rent, you should get your own box for performance's sake.

PM me if you have any further questions.

I hope you're not suggesting that I don't know what I'm talking about, lol. Cogent is prime bandwidth. And unlike other high-tier providers EV1 has a fully redundant network.

I owned (COO) a webhosting company that was based out of a datacenter in Seattle, WA. I'm quite familiar with upstream providers and what is reliable and what is not. Further, I have numerous certifications and years of hands on experience with live networks at that level; including global communication systems. So don't assume that I don't know what I'm talking about when in fact I do.

As for what xptek said:
(1) Nightma12 told me that you exploited a php vulnerability years ago - which is not only easy for any decent php programmer but a quick and permanent security fix.
(2) For someone that seems to know a lot about security (you were quoted saying his security is bad) you should understand that the IRC protocol is one of the least secure protocols ever designed which is the main consideration for EV1's position.

Let's not bump the topic too much, I want to hear Matix/teh-pwnerer try to defend himself. *grabs popcorn*

fl00d3d wrote on Fri, 29 September 2006 11:37
Cogent is prime bandwidth.
No its not, its cheap bandwidth that doesn't route properly. The fact that it doesnt peer with Verizon(formerly MCI Sprint) is also a strike against it. Having to go through Level3 to get to a Cogent-hosted box really sucks. Not to mention it sucks off the tit of Verio.

fl00d3d wrote on Fri, 29 September 2006 11:37
And unlike other high-tier providers EV1 has a fully redundant network.

EV1 isnt a "High-tier provider" its a datacenter that uses High-tier carriers (Tier-1). Name another

MAJOR datcenter that isnt fully redundant.

fl00d3d wrote on Fri, 29 September 2006 11:37
I owned (COO) a webhosting company that was based out of a datacenter in Seattle, WA.

Oh wow! I've been the CEO, COO, Tech Support, and Billing a 1000 times with my own hosting company.

fl00d3d wrote on Fri, 29 September 2006 11:37

Quote:I hope you're not suggesting that I don't know what I'm talking about, lol. Cogent is prime bandwidth. And unlike other high-tier providers EV1 has a fully redundant network.

Uh, are there any datacenters that DON'T have a "fully redundant" network?

Quote:I owned (COO) a webhosting company that was based out of a datacenter in Seattle, WA. I'm quite familiar with upstream providers and what is reliable and what is not. Further, I have numerous certifications and years of hands on experience with live networks at that level; including global communication systems. So don't assume that I don't know what I'm talking about when in fact I do.

LOL I HAVE MY CCNA CCNP NET+ A+, etc. Does it matter? No. Anyone can obtain those, and bandwidth providers really don't really have anything to do with that. It's a long shot, but did you happen to run your hosting company out of Swiftco in the Westin Tower? I'll be there next month.

Quote:(1) Nightma12 told me that you exploited a php vulnerability years ago - which is not only easy for any decent php programmer but a quick and permanent security fix.

Uh, it wasn't a PHP exploit. He allowed anyone to read any file on his box regardless of their user status, and still does.

Quote:(2) For someone that seems to know a lot about security (you were quoted saying his security is bad) you should understand that the IRC protocol is one of the least secure protocols ever designed which is the main consideration for EV1's position.

Hahaha. IRC is a plaintext chat protocol and does its job fine. What security improvements would you recommend?

And for the record, EV1 allows IRC (they even run their own support IRCd), but linking other IRCds is against their policy. This has nothing to do with the IRC protocol's security. Their network simply can't handle the DDoS attacks that sometimes happen.

Basically, EV1 is cheap generic Infomart-esque shit. Great for budget hosting or personal use, but you'd have to be insane to buy from a hosting company there.

I was suggesting that you don't go out of your way to tell someone that they don't know what they're talking about when they could be just as qualified to give an opinion. And yes we were in Westin. I believe he still is? I'm not affiliated with the business anymore.

Anything down in Dallas, TX is going to have a decent network as it is one of the best places to host a server on the planet. They have the most carriers, the highest quality carriers, bigger pipes running to-and-from, and service some of the largest sites on the planet at their location for a reason. Now I understand that EV1 is just one of a many -- but there are plenty of other datacenters in the world that don't have as nice of a hookup as they do down in Dallas.

As for saying that IRC isn't insecure: lol

Finally, I cannot vouch for what Nightma12 had in the past, but he's also working alone on a platform I'm sure he's not qualified to secure. So give him a break. That was then, and this is now. I'm just sick of hearing everyone on these forums claim to be some kind of uber l33t h4xx0r that knows how to do this and that. I'm not saying you don't ... but as a true geek (and if you are, you'll know what I'm talking about) these frustrations built up and when a topic like this comes along and it becomes a 'nerd fight' I just explode. 90% of the people on these Renegade Forums that talk shit are just under-aged kids that don't have any real-world experience.

To be completely honest I've been out of the "carrier" dealings for a little over a year now. So I don't know what has changed since then. But I do remember shopping around for better upstream and EV1 was on the top of our company's list.

IRC is too easy to sniff out, easy to abuse, easy to hijack, spam, etc. It is the reason why so many worms are successful and is the playground for hackers.

I definitely would not consider myself a "designer of protocols" though I do know a bit about a lot of stacks, but if I were to take a stab at a new IRC (which I think they're doing for IPv6?) I would definitely put more control information in the header of each packet so you can prevent the endless number of problems that IRC has in its history. You can't possibly think that IRC is secure, I hope....

fl00d3d wrote on Sat, 30 September 2006 15:36IRC is too easy to sniff out, easy to abuse, easy to hijack, spam, etc. It is the reason why so many worms are successful and is the playground for hackers.

Seriously. What are you talking about?

Here's how IRC works:

Server listens on a port.
Client connects to server.
Client joins a channel.
Client PRIVMSGs channel.
Other clients in the channel receive the message.

There's nothing that makes it more susceptible to being "sniffed out" than any other plaintext chat protocol. Most IRCds these days support SSL anyway.

Quote:I definitely would not consider myself a "designer of protocols" though I do know a bit about

a lot of stacks, but if I were to take a stab at a new IRC

Okay. This is where things go batshit insane.

Quote:(which I think they're doing for IPv6?)

What does IPv6 have to do with the IRC protocol? At all?

Quote:I would definitely put more control information in the header of each packet so you can prevent the endless number of problems that IRC has in its history. You can't possibly think that IRC is secure, I hope....

Are you talking about TCP/IP or something? It seems like you're a bit confused.

Look at http://en.wikipedia.org/wiki/OSI_model some time or something, because IRC has nothing to do with "headers" or whatever the hell you're talking about.

Quote:...Yeah because you can magically sniff client info out when you're not the server...

Quote:...plaintext chat protocol... That is where the problem starts.

You do not have to be on any server to sniff out its traffic. You simply have to be on its network segment. Hook your computer up to a hub and plug another computer into it -- then sniff out port 6667 on it and see what you come up with.   And for the record, not even SSL is secure anymore. Additionally, IRC likes to wrap up all kinds of information about its clients and hand them out to any users by default (ie. whois).

IRC6 http://www.irc.org/irc6.html I never claimed it was in the TCP stack. I'm not confused. Ironically I was going to ask you to post your seven layers of the model, but then I thought "any numbnut can google information". Again, I'm not saying you don't know what you're talking about -- but you're really going off the deep end insisting that IRC isn't insecure. And for the record, I never once said that the other protocols were any more/less secure. Though I do think that IRC

has no place on a secure network. Other protocols have more control information and well-established signatures that can be filtered by IDS's. IRC does, too, but as you've pointed out yourself it is a different kind of protocol.

You went through the trouble of listing out your certifications which apparently makes you a resident expert of security. So tell me, how many servers have you hacked? How many times have you exploited the IRC protocol? How many times have you done 'penetration testing' professionally?

It's supposed to be a plaintext chat protocol. That's kind of the point.

I'd suggest you reevaluate your "insecure" judgement when you've developed a few IRCds yourself.

What? Why would I hack a server because I have some retarded certs?

Quote:Hook your computer up to a hub and plug another computer into it -- then sniff out port 6667 on it and see what you come up with.

Sniff port 80, change your forums password, and see what you come up with.

Oh and maybe use a switch so your data isn't blasted to every computer on the hub and its uncle?

That only works if you're physically in between the the client computer and the modem.

I'd suggest you reevaluate your "insecure" judgement when you've developed a few IRCds yourself. That is the point of the protocol: to be an insecure plaintext protocol. And because you have worked with IRCd doesn't make you a security expert on it.

What? Why would I hack a server because I have some retarded certs? I was making a point ... and that point was, that just because you know something about servers, services, or protocols doesn't mean that you understand the security risks with it. I, on the other hand, have done all of those things and have a lot of experience with "hacking". And not the script kiddie, "lets download a point-and-click port flooder" kind of hacking either. That doesn't count.

Sniff port 80, change your forums password, and see what you come up with. Oh and maybe use a switch so your data isn't blasted to every computer on the hub and its uncle?[/size]

Dedicated servers are usually hooked up to their own port on a switch, yes. But ports can be mirrored, clients can be compromised, and you still have a protocol with no built-in security to stop things like 'Joe Anonymous' from whois'ing your IP/hosting/etc. information or sending you .exe's cuz you're a dumbass and you accepted the file. It's definitely not built to be secure. Thus why any intelligent host would be selective about how they permit the protocol on their network.

Yoshimitsu wrote on Sat, 30 September 2006 16:22That only works if you're physically in between the the client computer and the modem.

You wouldn't be more wrong. ^^

Quote:That is the point of the protocol: to be an insecure plaintext protocol. And because you have worked with IRCd doesn't make you a security expert on it.

It's not always plaintext, and the fact that it's plaintext doesn't make it inherently insecure.

Multiple IRCds, btw.

That doesn't count.

Oh fun. Mindtzar and I used to automatically root 1000s of Chinese/Taiwanese hosts back when we were nice and 'tarded. What does this have to do with the security of a protocol?

Quote:and you still have a protocol with no built-in security
I guess EV1 should disallow HTTP too.

Quote:to stop things like 'Joe Anonymous' from whois'ing your IP/hosting/etc.
Most modern IRCds have full hostmasking. I don't know where you're going with this one..

Quote:information or sending you .exe's cuz you're a dumbass and you accepted the file.

IRC has no built-in file transfer method. DCC is not part of the IRC protocol.

You can only accomplish it as a MiM.

I don't want to argue about IRC. This is getting a bit absurd. Have fun with IRC

As for EV1, it is a matter of preference. You've stated your opinion (which was targeting Neron Hosting) and I've stated mine. Life moves on, I have better things to do with my day.

You could have just said "I lost this fight because I have no idea what I'm talking about. I need to educate myself in this subject further before a formulate an opinion on the subject."
