Okay guys, this one shouldnt be to hard.

I want a good computer, with:

160 GB hardrive,

1-2 GB ram

a good graphics card,

a good processor, around a 3-4 GHZ

and a new mother board

Willing to spend around 1000 bucks or so. Mainly a gaming computer.

I need to know specific parts, prices preferable, and performance.

Since im a noob with computers, im hoping someone can build me a computer >:P

This might get more help in General Chat.

\$1000 Canadian or US?

You do notice Ghz in a processor doesn't mean its necesseraly better then others..

Like the Core 2 Duo E6700 has 2.6Ghz I believe, and it out performs the Pentium4 EE 3.67Ghz in everything! And core 2 duo has a whole ghz left! I mean, of course you can overclock it that high, and you will have a cool-kick ass pc.

---

I recommend what I just got..

E6600

2GB Ram Croshair XMS Gaming Series

150GB Raptor X SATA (16MB Cache, 10K RPM) This is a bit pricy, but its the fastest type of HDD around. (Yeah, faster then SCSI, afaik..)

I also just got a 7950GT, very nice! \$300 as well..

All this should come to around \$1200 (You can always downgrade your HDD...)
