Allright, so a buddy pulled me into renegade modelling. Although i cant even model a cube in renx, i felt like trying out 3dmax 8. So i installed the 30 day trail. I than downloaded the w3d tools ea released (way too late). I dropped all the files where they should be dropped, fired up 3dmax, and got this cute error.

In total shock i doublechecked the readme, but no good.
I probably just forgot something even a retard can do...

help

edit: the dutch part says "cant find the requested module"
and yes, im sure everything is in place, at least i hope so

Put "Max2W3d.dle" in the plugins folder.

Okay, this is what you do, and don't say 'oh i have that' becuase you don't, you may, but it may be curropted.

Download this, DX 9.0C installer and install it.

And ONLY AFTER you download and install it can you post or i will not help you get it to work.

Lol, you make it sound like you stole my candy...

Anyway. I downloaded it, opened it, and tried to install it.
Where it said "will now check your previous versions and update where possible" i pressed OK.
It was done in less than 1 second so i assumed im up to date already.
I even tried to uninstall it to than reinstall again, but it doesnt pop up in the software list, so i
couldnt.

After that i started 3dmax again, only to get the same error smacked in my face again.

edit: the new w3d viewer also reported a missing dll (d3dx9_27.dll), so i googled it and
downloaded it. afterwards i put it next to w3dview.exe and the viewer lived again. i smell a
relation...

problem solved, i moved that dll file to my system32 folder. now both 3dmax and w3d viewer load
if from there.

i find it weird, i freshly reinstalled dx9, checked wich dll files were installed and noticed just this
one file was missing. Other dlls named d3dx9_xx.dll (where xx is 24 to 31) were installed, just not
the needed number 27.
