If you are getting crashes showing mp3dec.asi or mss32.dll right at the top of the crashdump (or at the top of the stack trace), it means that for whatever reason, the methods used by renegade to play music dont like whatever music file is being played. There is nothing I can do about it without access to the renegade source code.

Couldn't you rewrite the music code and hook it to BHS.dll? or is that too much work?
