Ok , I got all the parts and put them together. Hooked up all the cables. It boots up and I set the time and date in the BIOS. Are there any drivers I need to load before installing windows?

(whats CMOS stand for)

CMOS = complementary metal oxide semiconductor.

Drivers, well that would depends if you're using a RAID. You would have to install the RAID before installing windows. It asks this before installing. Other then that, no. You install the GFX etc..After you've installed windows.
