Yeah, so we did a virus removal at my work (Staples Business Depot) for a customer, and look what we found:
(Anyone Ever See That Many?)

Also I thought I'd share with you What I did to setup for Vista:

My parents computer at one point had somewhere around 18,000 infections and after the virus scan was completed and deleted the infections, they all came back so they ended up doing a reformat.

As for Vista, according to reviews on Newegg and other places, it has horrible driver support, some programs will not work, and things crash. Also mentioned was that its not worth it due to the huge memory consumption (2GB just to run smooth), and the only good thing about it so far is that it has a new and better file system.

18000 viruses WOW!

Ive been using vist for a couple weeks. ive installed many programs on it that ive had on xp, and all works fine. now as far as drivers, i havent really tried to install anything on it.

Will i be getting vist? for sure.

Sure there is a lot of "eyecandy", but the ease of use is amazing.

My old PC wouldn't have been able to handle the "eyecandy" not to mention the 20GB (That the right size of Vista?) would have been half of my HDD (yep, 40 GB HDD, those were the days...)

Developers are making the mistake that everyone uses uber speed hardware, were it not for the weather, I'd still be using 768 MB of SDRAM with an AGP 4X graphics card and an Intel 845G chipset (yes, the old Socket 478 square block heatsink one)

something to think over.

All viruses replicate, nubcake. If it doesn't replicate, then it's not a virus.

I absolutely agree with that. It's ridiculous. Not only do many developers think everyone has a

l33tbox of pwnage, but they also think that their little programs are the only programs that are going to be running. So what's the consequences? You get massive amounts of memory, CPU, and network usage and no *REAL* speed increases compared to machines that could do the exact same thing 10 years ago in (quite literally) the same amount of time.

What's really retarded is how manufactures love to discontinue hardware as soon as something new comes out. It screws over anyone who has a pretty old system and is looking to do some not-so-major upgrades because of not having the money for a whole new fast computer. It really pisses me off how it's almost impossible to get any socket 939 or 754 motherboards anywhere unless you look on places like Ebay, which usually has used hardware without any warranties. So much for everyone saying that socket 939 wouldn't die for a long time.

The stuff they discontinue isn't even that bad at all. It's still pretty powerful hardware. It's human nature to throw out too much.

Subject: Re: HeHe Anyone Every See Anything Like This?

[View Forum Message](#) <> [Reply to Message](#)

I know what you mean. I had a difficult time finding a good socket 478 motherboard. The MSI motherboard you had linked me too was discontinued before I was able to buy it, and I ended up searching a long time for another good motherboard. Its a pity when they discontinue hardware like that, they actually lose a lot of money from legacy builders.

Not true really. We've already got a Toshiba Laptop with Vista on it in the staff room. It's only got a gb of RAM, and it's fine. (Mind you, it idles at about 512mb used) 2gb is overkill. And yes, this is with it running Aero. It's a damn fine operating system. Some big changes in the way of finding your way around, but once you get used to it, it's nice.

I don't know about driver support, because we haven't installed anything on it, but I don't think it will be that bad. Once Vista officially comes out, I imagine companies will be putting out many new drivers.

Quote: It's only got a gb of RAM, and it's fine. (Mind you, it idles at about 512mb used) 2gb is overkill.

However, I don't think that will nearly be enough RAM for heavy multitaskers such as developers or people who play games. Of course it will run fine idle with 512MB used, you're not doing anything and its just the operating system running. If your playing a game like FEAR for example, that 1GB of RAM isn't going to help you much.

Though, it completely depends on what you plan to use Vista for, but I truly doubt that 1GB of RAM will suffice the majority of the end users who use Vista.

I thought you were just talking about making it run smooth.

And remember, people were probably saying 1gb of RAM was OMGamazing back in the Windows 98 days. The hardware will rise up to meet the software. When I got the PC I'm using now, it had 512mb of RAM, and that was wicked. ~4 years later, 2gb isn't that uncommon (I have 1 gig in it now). 1 GB has been pretty standard for a while now. By the time there's a reason to upgrade to Vista besides making your ePenis bigger, then I'm sure a PC with 2gb of RAM will be common.

CarrierII wrote on Sun, 28 January 2007 12:49Yeah, but 2 GB of RAM isn't overly cheap.

It will be eventually. The prices on electronics come down remarkably fast. What you pay for 2gb right now will be able to buy you 4 gb eventually.

Quote:I thought you were just talking about making it run smooth.

Vista isn't going to run smooth if you run out of RAM while running software applications.

Quote:And remember, people were probably saying 1gb of RAM was OMGamazing back in the Windows 98 days. The hardware will rise up to meet the software. When I got the PC I'm using now, it had 512mb of RAM, and that was wicked. ~4 years later, 2gb isn't that uncommon (I have 1 gig in it now). 1 GB has been pretty standard for a while now. By the time there's a reason to upgrade to Vista besides making your ePenis bigger, then I'm sure a PC with 2gb of RAM will be common.

You're forgetting that not everyone has the funds to get 2GB of RAM. 2GB of RAM for a good set still costs around \$250-\$350 depending on the quality and brand and even 1GB of RAM still ranges ~\$120. And not everyone is going to upgrade their hardware right away to "rise up to the software", especially when both the hardware needed and software application are expensive.

Quote:

It will be eventually. The prices on electronics come down remarkably fast. What you pay for 2gb right now will be able to buy you 4 gb eventually.

Then they develop a new kind of RAM that is supposedly the newest, greatest thing that everyone must have. Then the price is right back where it started, high-dollar.

Yes, but it's not like the old stuff ceases to exist. And it's not like Vista will morph to need 4gb of RAM just out of spite. 2gb is 2gb (yeah, I know, lol clockspeeds or whatever. But the stuff that's out now will be fine. Just cause something becomes obsolete doesn't mean that its performance becomes any worse.). The price will go down, and obviously, something will replace it, but that doesn't mean you have to use the new stuff.

I have 1GB of memory and I wish I had 2GB. It's not so that I can look cool, it's because I actually need it. I'm only running Windows XP and I don't plan to go to Vista until there are a few DirectX 10 games out that I really want.

Subject: Re: HeHe Anyone Every See Anything Like This?

Quote:Yes, but it's not like the old stuff ceases to exist.

Some legacy parts cost more than new parts due to lack of supply.

Quote:And it's not like Vista will morph to need 4gb of RAM just out of spite.

I never said it would, I was reinforcing the fact that 1 gigabyte of RAM will most likely not be enough for the majority of users who will buy Vista.

Quote:Just cause something becomes obsolete doesn't mean that its performance becomes any worse.).

I never said the performance would become any worse. I have many discontinued and obsolete parts in my computer and they run the newest of applications just fine.

Quote:The price will go down, and obviously, something will replace it, but that doesn't mean you have to use the new stuff.

When new hardware comes out and it is the latest and greatest thing, we all know that software developers target the new goodies. So in the end, if you want the newer software, you're going to end up buying newer hardware.

okokok well lets talk ram.

I paid \$300 to put 2 more GB's of ram in my server comp. putting it to 3GB

no definitely not cheap. But we're overlooking something. if you want to speed up vista, and you have a 2gb memory stick (usb drive/key) you can use it as ram its called ready boost, and it is in fact my favourite part of vista. we took a 2 gig stick and used ready boost.... all i can say is WOW. (memory sticks are a lot cheaper than ram.

using a computer for anymore than five years, will most probably make it out of date, but i've got my own solution. If i buy a comp for \$800 and use it for 1.5-2years i sell it for 500 -600 and put that towards a new machine. mind you with my job, i need to keep up on these things.

Do computers change too much?

Yes they sure do. Every three months, but now manufactures are at a poin, where the prices are always the same (\$800 machine starts with 1gb then 2gb, then next year 3gb)

My Solution, Live in the Past, You'll Save Alot of Money

Quote:My Solution, Live in the Past, You'll Save Alot of Money

That's the spirit! I just upgraded all my parts and am still using a Pentium 4 with a 533MHz bus (overclocked to 600 something) and it runs all the new stuff just fine! Not only that I saved loads of money by not switching to PCI-E. Eventually I will, but like you said, live in the past and save a lot.

Article on power efficiency:

http://www.bit-tech.net/columns/2007/01/25/starting_at_the_sun/1.html

Also, my rig doesn't have any of the new top-of-the-line garbage everyone expects you to have. Here's what I'm at:

Athlon XP 2600+
1GB DDR PC2700
Leadtek Geforce 6800
200GB Maxtor ATA133

I can run all new games fine, and most of them on high. Whenever I buy a new computer, I like to stay with it for at least three years with small upgrades here and there. Saves you a tremendous amount of money. I have only built two computers in my lifetime so far.

I've only built one (fu*king weather)

Hmm, I have a couple of old spare USB memory sticks, that's an interesting feature of Vista...

Here's my rig:

ASUS P5LD2 (Socket 775) Mobo.
PCI-E X 16 based ATI X1650 Pro 512 MB (<3)
Intel P4D at 2.66 Ghz
1 GB RAM (cheap) @ 557 (I think....) Mhz
Four £24 Maxtor SATA II HDDs in a RAID 0+1

Posh, but still slow sometimes, didn't cost too much actually, because my case was only £45 and I already had a monitor

Radeon x1650 hhhhhmmmmmm very nice card

well my machines:

1. HP Media Center M7330n

3072mb DDR 3200 Ram (upgraded from 1GB)

AMD 64 X2 4200+ 2.2Ghz

250Gb Hard Drive

Radeon X1300 256mb video card (wanted the x1650)

Cost:

Machine \$450(steal Deal) Ram up grade \$300 Card \$100

Total Cost \$850

2. HP M7260n

1024MB DDR 2 4200 Ram

Pentium D 830 3.0Ghz

300GB Hard Drive

ATI Radeon x300 128mb Pci-e

Machine \$250 (another Staples Steal)

Total \$250

Best thing about working in retail, stuff that sits and sits, for even only 3 months, just falls in price.

I also have three other machines, but im not as happy with them...
