I am using the old renegade, not the first decade one and Windows XP Home with all updates.

I start renegade, i get:

```
[17:58] Warning. No WOL Name found. Connecting to WOL will probably fail
[17:58] Trying to connect to server #1...Connected
[17:58] Secure link established.
[17:58] Welcome to RenGuard, !
[17:58] To launch Renegade, please click 'Renegade'.
[17:58] WARNING: Model Textures (Skins) have been detected on your client! You will not be
able to join a pure server.
[17:58] RenGuard is downloading an important update for your Renegade.. Please hold.
```

Appearntly I ignore the last bit about the update as it is something about a beta version.

So i continue by clicking renegade and the renegade configuration pops up. So I set it to the settings I have had all the time and press OK.

My screen flickers (Normally does that before loading renegade) and then I get the message below everytime:

If I ask game2.exe to load, i also get the message above.

Before:

RenGuard is downloading an important update for your Renegade.. Please hold.

Appeared, renegade loaded like normal, what has happened?

Ahh, i have just tried to start renegade and it works although the update message is still there

I am happy again

Still can anyone figure out why it happened in the first place

Meh, something random happened, it doesn't matter if it still works.
