[View Forum Message](#) <> [Reply to Message](#)

scripts.dll 3.4 is out.

Get it from <http://www.sourceforge.net/projects/rentools/>

The primary purpose of this release (coming so soon after 3.3) is to add some features RA:APB needs for their next release

There are also a bunch of bug fixes.

Now that this is out, I don't plan on another release for a while (unless any critical bugs show up)

Updates to the Normal Map shader (it now correctly handles fog on both SM2 cards and SM3 cards)

Updates to places where windows.h and the direct3d header files are #included so that they are only ever included from the one place.

Fixed some more PREFast errors

Updates to Draw_Skin to work correctly with the normal map shader

Updates to the Scene Shader code (this fixes the alt-tab problem people have been having)

Updates to the Multisample Anti-Alias code (its now much cleaner and uses less memory too)

Removed Texture_Exists from engine_3d because it was broken and not used anywhere

Added a new function AddCombatMessage to engine_3d so that shaders can output messages to the chat window of the client

Small update to DebugOutputClass::Assert in engine_diagnostics

New engine call void Ranged_Variable_Percent_Vehicle_Damage(float EnemyPercentage, float FriendPercentage, bool ForceFriendly, const char *Warhead, Vector3 Location, float

DamageRadius, GameObject *Damager); //damage vehicles based on a percentage factor

Changed #define Simple in engine_obj.h to #define SimpleObj to prevent a conflict with one of the standard Microsoft headers

Updated IsInsideZone so that it works even when the zone has no idea the object is inside it

Fixed a major bug with Set_Vehicle_Gunner which was affecting the vehicle management dialog

Fixed a bug with Copy_Transform in engine_phys.cpp

Added some debug code in places where we access parts of the PT data so that it wont error when compiled with debugging enabled.

New engine call void Hide_Preset_By_Name(unsigned int Team, const char *Name); //Hides a preset by name

Fixed a bug in Find_Object_With_Script

Fixed several bugs in SimpleVecClass and SimpleDynVecClass

New script JFW_PT_Hide which hides an object on the sidebar

New script JFW_PT_Hide_Death which hides an object on the sidebar on death

New script JFW_PT_Hide_Custom which hides an object on the sidebar on custom

New script JFW_Follow_Waypath_Zone which makes anything of a certain preset that enters the zone follow a waypath

Updates to JFW_Escort_Poke so that when the person being followed pokes the object again it stops following them

New script JFW_Vehicle_Reinforcement which spawns a vehicle reinforcement and makes it follow a waypath

Fixes to the Scope code in mdb.cpp so that it doesn't try and use the Scopes object if it hasn't been initialized

Some changes to the critical section code in mmgr.cpp

New script RA_MAD_Tank_Devolved to implement some Friendly Fire changes for the RA:APB Mad Tank

Further updates to the Shader Plugin interface

Updates to ShaderStateManager

New script SH_FileVerificationControllerScript. This is used along with some code in apbshaders.dll (which is APB specific) is used to implement file validation of certain key files.

There is a new feature in bhs.dll that changes the default sort order of the WOL Server list dialog to sort by current player count instead of by name as a default

Fixed a crash issue to do with the Stop_Background_Music console commands and engine calls

There is a new feature that lets you hide an icon on the sidebar

Fixed a bug with Set_Shader_Number and SendHUDNumber. Both engine calls should now work.

Further updated the code for TTF based fonts to provide even more space.

How exactly do I install this? Which of the seven million files in the .zip file do I put in the Renegade folder? I've never installed one of these before so I'm a bit in the dark... I also couldn't find an install.txt or a readme that was about installing it.

[View Forum Message](#) <> [Reply to Message](#)

Doitle, the following go into the data dir:

- *.fx
- *.dds
- *.tga

The following in your renegade main folder

- *.sdb
- *.dll
- *.exe

If you really never ever had a custom scripts.dll file, then you should first rename scripts.dll to scripts2.dll and then do the above, however you probably already got a copy from a core patch or something like that.

Jonwil, maybe add (something similar to) these instructions to some file like install.txt?

[edit]

Better yet, make a "Install" folder and a "source" folder. Then noone needs to pick the right files manually either.

Subject: Re: scripts.dll 3.4 is out.

[View Forum Message](#) <> [Reply to Message](#)

Correction, the *.sdb files should be in the data folder as well. (Thanks for pointing this out Cat998)

Yeh, it seems jonwil doesn't really like folders.

It's a real chaos.

Like the FDS log files and pretty all the other Renegade files. Someone should change this finally.

In both, scripts and FDS (and ren client).

Personally i'd halt on these...

IRC #serverowners[22:19:28] <Herr> I crashed 5 times since I installed 3.4

John, talk to Herr about that and see what's up.

Also, have you fixed issues for ATI card users? (and don't just say "get an nvidia").

Nice, the fog works. Question: Why are there only 2 normal maps included? Is there an easy way to make some for the rest of the vehicles?

There seems to be a new bug that's cropped up with this, after installing the 3.4 scripts, I end up randomly starting to get weird lag, chopyness that just gets worse until the whole game freezes completely and I have to manually reboot the system.

Actually, this is happening to me as well...thought it was freezing because of all the browser windows when I tested the fog, but it happens every time.

Apologies for the general crappiness of this release.
There is a memory leak in a piece of code that gets run a LOT. Somehow this memory leak was not picked up by our memory leak checking code and testing.
It has already been fixed, the fix will be in scripts.dll 3.4.1 which is due out shortly (one other issue to fix first)

[View Forum Message](#) <> [Reply to Message](#)

Ok i've had some problems with 3.4, I used the installer to install this time and I noticed that I had a few new files in my /data folder. *.sdb's I thought nothing of it just played like normal untill the memory leak kicked in and FPS dropped. So I just replaced the *.dll's from the 3.3 and everything seemed ok untill I tried to alt-tab out and it would just crash. So anyway I cont. playing and then I noticed some of the textures? on the mammy and flamer were dodgy(AAx4). So I removed the *.sdb's from my data and all is well. Anyways here are the crashdumps + d3derr and ss's

Quote: This is from the d3derr file:

Error, call to CreateAdditionalSwapChain from 0x0058859F

Error, call to CreateAdditionalSwapChain from 0x0058859F

Error, call to CreateAdditionalSwapChain from 0x0058859F

Anyone using that posted shaders.dll and getting an error about d3dx9_33.dll, thats because Saberhawk compiled the dll with a newer DirectX SDK than I use. You should be able to find d3dx9_33.dll with google or you can wait for me to release scripts.dll 3.4.1 with the memory leak fix in it.

Windows XP Professional MCE edition 32-bit
2.0ghz Dual Core Centrino
2gb RAM 2 Dimm
Gforce Go 7600 512mb

This crash occurs on M10 randomly. Seems to run fine on multiplayer but SP seems to be giving me some trouble. Default 1037 scripts run the map fine.

I also tried disabling the high detail shadows and shaders.

Wowzers! I went in to test if I would be able to detect the memory leak... I was playing fine and then WHAM. That leak hits hard and it hits fast. In the course of about 5 seconds it went from 75fps to 1fps to freeze. I was like o_O. Anyhow good luck with the 3.4.1 release and getting this nasty little thing out of here.
