I've created a redirect script for my mod site (planetcnc.com/phx), since it's on a dynamic gamespy server, and that url is just too long...Just type into your address bar "planetcnc.com/phx" to visit the index.php of my site, or you can type in "planetcnc.com/phx/" plus one of the available commands listed below (type in "planetcnc.com/phx/?bb" etc.)...nothing (just type "planetcnc.com/phx", goes to home)?bb (the forum page)?dl (downloads)?gdiv (the gdi vehicles page)?gdiw (the gdi weapons page)?gdis (the gdi structures page)?nodv (the nod vehicles page)?nodw (the nod weapons page)?nods (the nod structures page)?help (the help)test my new script, type these into your address bar...type ?help for the list of commands, what the url should look like, and where it goes...try typing in a non-listed command (like ?thisdoesntexist) and see where it goes...)If anyone would like to use this script post here, or pm me with the list of commands you would like, the pages it goes to, and what they have to type in the address bar to get it (take alook at my ?help file). and i'll create more scripts on my server just for your site, and give you the info on how to add it to your site.
