So I have 3 computer that connect to 1 router, on this one computer(mine) when I try and check my emails on hotmail it disconnects me and only me then I have to reboot the router, is there any setting in the router that might cause this?

EDIT: This computer is connected wirelessly.(duh)

What wireless router are you using?
Since when did this problem start occurring?
Hotmail instances on other pc's work fine?
What have you yet tried to fix the problem?

Well it's a Dlink WBR-1310 router and I turned on Mac filtering(and put it on only allow the listed ones and put the three computers in there) a while ago haven't tried hotmail with that off I will try later.

EDIT: Wasn't that I can't really think of anything else I did other than blocking one site(wasn't hotmail.com of obviously).

2nd EDIT: Odd I had website filtering turned on to "deny access to list" and I had limewire.com that is all I had there, just thought I would try with it off, and now it works very odd.

Bump

Router doesn't seem to like it when I block a website any ideas why?
