Yes, I have posted on their support forums, there are just some smart people here too...

I just installed ubuntu 7.04 from a live CD on a P4 w/ 1.5 GB of DDR 266 RAM, a maxtor 60GB drive and a radeon 9550 (it's supposed to function as a home server, it's just not booting)

Well, it is, kinda, it gets to the splash screen and then gives

```
udev-event[1938] - run program : '/sbin/modprobe' abnormal exit
```

Any ideas, anyone? If I need to update a file, that's fine, I can use the live CD to boot the PC and mount the HDD, and I have a 4GB USB key to move things around with.

I'm not a big Ubuntu guru or anything, but I'm thinking that message means that particular application is corrupted. Chances are that I'm completely wrong, though, so don't quote me on that. Did you get an MD5 hash of the Live CD image when you burned the image?

Yes, it's clean.

Edit, worked around it by using 6.06.1 instead of 7.04. I'll just have to live with the limited features, nvm.
