My partners pc has this "clear debug and try again" message everytime he goes to try and play renegade. He's search the internet and found suggestions about sound cards and software that can cause this but he has none of them.

As an after thought I thought about renguard (we've not played it in a while and this was the last thing to go onto the system) but I have a problem trying to get round the detection of WOW because he's not had a chance of getting into the game to set up his user etc, renguard wont get the game playing.

Is there anyway it can be done by going into the file or copying the file on my pc with my details on just to see if we can bypass this part and get this game running?

I'd be ever so grateful if we can get this to work.

Need more details about hardware and Windows version, plz.

Also a screenshot of the error message if possible.

I've been a busy gal but I solved it!

Here's the run down for anyone out there

Install ren as usual, do the update via the start menu because its the only way!

If a no cd patch is required install after update

Install renguard

It might come up with no WOL found it might fail and my first time it did, but just on the off chance I hit it again and it let me into the game, account set up and off we jolly well go!

It took me ages to do because I didn't put in the no cd patch and had to go through the installation again but with or without it works, another reason why renguard should be installed on your

---

system. Thank the gods for Renguard!
