Wow, cool!

For the people who don't get it, you need to watch directly at the black dot when its counting down, don't move your eyes and stuff. Then, when its done counting, keep looking at the same spot, and you will see the castle in color

That's a cool trick with your eyes. I think it has to deal with your eyes seeing a negative of something like that. I tried it with a photo of mine in Photoshop. I inverted the colors, then put a grayscale image underneath it. It worked.

It has to due with color's burning on your Retina and negative colors. For example, if you watch too long in the song, then look away, you will still some spots while looking at other things. Its mostly a combination of different colors, as it is actually white, white through a prism --> all colors, thats how a Rainbow works too, where the rain is the prism to separate the white sun light in all colors.

When you watch really long to a square which is separated in the middle; White on top and black down white. When watching directly towards for a while, then look somewhere else, you will still

see the box, but the colors are inverted (Black on top and White below it)

Yeah, I'm sure most of us understand the physics behind the visible light spectrum.

Omg, can you do this with every picture?

This is freakin cool.

Enough with the illiteracy. Try reading the rest of the thread...

cheesesodal tried it with a photo of mine in Photoshop. I inverted the colors, then put a grayscale image underneath it. It worked.
