The president is finally deciding to lift the ban of no drilling for oil in America, and off American coasts. GJ! Only about 3 years too late. This could have worked before the Democrats took control of the Senate and the House. Now, President Bush will have to figure out how to get them to see it his way, when Republicans are not only the minority, but also on a totally different plane than the Democrats. At least he's trying to do something to help us out.

Everyone should stop complaining and move to Venezuela if they care that much about fuel costs. If they want to care even more I suggest moving to Norway .

I won't mind at all driving this to work:

http://www.mytricycle.com/images/img_1977.jpg

Provided the government makes provisions for such human-powered vehicles on roads. I might send a letter to the government on this matter as the oil price/problem will only increase.

EDIT: Changed my mind: I am going for this: <http://www.davincimobility.co.uk/images/trike.gif>

4 Dollars a gallon...

Gallons are stupid.

So is your face! OHHHH Yeah that's right...I just sank to your level.

Anyway on topic I really don't see a good reason as to why it shouldn't be allowed, of course I think the states should have sway on the ultimate decision of whether or not oil companies should drill off their coastlines.

Good luck getting the stuff. North America is rich in oil, but so much of our stuff is a pain the ass to even drill for.

There's an oilfield in the Montana, and Dakota region that is home to a few billion barrels of oil, but the drilling process would require that they would not only have to drill down into the Earth, but horizontally too, in order to get between the shale. A process like that is expensive, and oil companies would charge even higher prices on fuel just to create the infrastructure needed to do that.

Plus, it's been worked out that this particular oilfield would last the United States about nine months. There are other places in the States with oil, but like the Bakkan oil region, it'll be hard to extract and process.

Instead, we ought to start getting serious with 'alternative-energy' sources. A hydrogen economy is the finishing line, but there are plenty of hurdles left on the track. Power generation should be the first area of change... investment in Nuclear generation would be a great first step, because it is comparatively clean to fossil fuels, and a Nuclear Plant occupies a relatively small footprint. Plus, with incoming electric vehicles from General Motors, and Toyota, there will be more strain on the power grid.

Heh, 9 months the way the USA drills for oil...

You guys really need to reevaluate how its done down there.

I don't know where my Oil and Gas Law instructor found the picture, but it was of a building in the US that was wall-to-wall pumping stations. This means that all the oil is drilled quickly, with stuff left behind in the well.

Meanwhile up here in Canada we are limited to 1 well per section (or is it quarter section?) of land. This means that the wells last longer, and more total oil is pumped.

Heh, under VERY controlled situations this would be interesting to see.

I could just imagine if a swarm got loose in a forest though...
