I just got the full version. and when i test it to see if the server is working right i get this.

Quote:Connection test failed.

Your server appears to be behind a NAT router with IP address 71.113.224.112. You will need to configure that router to forward port 5500 to this computer before you will be able to connect to your server over the Internet.

I can connect to my self fine.

I have port forward all there port's still same thing

I can't even connect to other ppl.

I have it and had a problem like that...my pc can connect but my moms pc would not....What i did is the ports it has set i forward into my router,and windows firewall and etc of everything else you need.....another thing is you need to type in your routers external ip for that pc like mine is 192.168.1.XXX and my moms is the same except with the last digits...And also check all settings and make sure they match up...
