The picture anyways I was trying to send a picture to a friend of mine and....well....I didn't really want it to be a link, instead I decided I wanted it to be a code for the browser to automatically download into the E-Mail message itself But I don't know how to do that *thought I tried many times to do it probably sending over 25 E-Mails to myself with......no positive results. Does anybody know how to do this.

Why not just attach it to an email or is that what you are trying to do?

I knew I should have made an example. Ok......no I am not going to attach a 4M.B. file that I already uploaded to my 4shared account that give me a *direct link without any ads just the picture get the point?. Anyways lets make an exaple. Ok I have uploaded a picture to my 4shared account. Here is the direct download link.

  http://www.4shared.com/file/68043340/2565b7e6/Picture_Page.html?dirPwdVerified=d 3f46b77

Here is a link that has just the picture and no ads.

  http://dc11.4shared.com/download/68043340/2565b7e6/Picture_Page.bmp?tsid=2008102 2-234959-b249d925

How do I make it so that when I send an E-Mail to my friend, his browser will automatically download the picture into the message, all I have to do is give him a link the the uploaded picture, but the problem is with the link I don't know witch one to give him so that it downloads directly into his browser.

I think it would depend on what browser or email service your friend uses really, if you were to figure something out to show it it might not work for your friend because they are using a different browser or email service.

Why do you want his computer to "download" the image? If you want the picture to just show up in the email then use HTML. If you are trying to send him the image send it in an attachment. Or even tell him to go to that address and right click on it...

The only reason I could see someone wanting to "force" a download when someone views an email is for fraudulent reasons.

Can you tell me more about the H.T.M.L. part, this is not for fraud purposes, this is merely done to save me and my friend time that rather than opening up new tabs and I find it to be much more convenient it eleminates extra steps that are not fun to do.

Oh yea because right clicking and pressing "open link in new tab" or simply clicking it is so hard...

I frequently get clients to send me photographs for their websites over email. Lots of times theres anywhere from 10-20 pictures per email. I used thunderbird and I can just right click and choose save all. Most email applications support some kind of function like this.
