[View Forum Message](#) <> [Reply to Message](#)

Post your computer specs(doesn't have to be all can just be the main ones: RAM, Processor, hard drives, video card, operating system) and Connection speed test results(from <http://speedtest.net/>).

Here's my test results:

My System Spcs(this is a laptop lol, not very good but meh):

Processor: Intel Centrino Duo(2.0Ghz)

RAM: 2.5GB DDR2

Hard Drive(s): 1x 160GB

Video Card: Intel GMA 945(Integrated)

Operating System: Windows Vista Home Premium 32bit

[View Forum Message](#) <> [Reply to Message](#)

I'll hold off on system specs for a while...Getting new computer :soon: (Yes, I keep saying that)

Here's my speed test ->

Crappy upload, but excellent download. I've tested this for the last two weeks and the download speed has been about what it is now.

EVE IS DEAD!

But here is my speedtest results from my Laptop. If I was on my actual desktop, it would probably be much faster:

The specs of my desktop were, however:

Intel Core 2 Duo E6600

2GB RAM

540GB Hard Drive space

PNY GeForce 9800 (1024Mb)

650W PSU

Windows XP (SP3)

I also have an old AsRock Mother Board.

Since I decided to reconstruct my PC to make Eve 2.0 (EVE the space MMO has absolutely nothing to do with that name).

The new parts include:

1. MSI P7N Platinum (Motherboard). It uses the nVidia 750i SLI chipset. Supports up to 8GB RAM and has 3 PCI-E slots. (One x16 and two x8). 4 SATA ports as well as 2 e-SATA ports. 4 USB and 1 firewire. Surround sound, ect. It runs Intel processors.

2. 4GBs of RAM. I'm planning on upgrading to a 64-bit OS because of that.

3. 500Gb Harddrive replacement (old one was 40Gb)

4. I'm also going to be buying a new chassis.

Eve 1.0 was nuclear green. 2.0 will be demon red. :V

OMG andr3w282's slaughters us all /me dies

I forgot about my desktop I'll go ahead and post the specs of it:

Processor: AMD Athlon 3100 2.2Ghz
RAM: 1.5GB
Hard Drive: 160GB
Video Card: Nvidia 5550 512MB
Operating System: Windows XP Home Edition 32bit

I got that thing maybe 4-4.5 years ago(maybe only 3-3.5) it's still running pretty well, and that's about 3 years(I think) without a windows reinstall

EDIT:

@ Saberhawk: What's the model number of that one? I assume you bought that recently?

I'm on a 2.5Mbps Qwest VDSL line here. It's the fastest we can get until we move somewhere else. 2.5Mbps just kills me when I need 20Mbps!

Computer Specs
Core2Quad 6600 (2.4Ghz)
4GB 1333MHZ Ram
2x500GB Raid 1
1x750GB Media
9600gtx video

This current system isn't really cutting it for me. I have a lot of programs open and need to get a lot done on a daily basis. My next system will probably be this:

Newer Core2Quad's. Perhaps an Extreme
8GB Of Ram
2x300GB SCSI Raid 1 - (Work Related, and maybe some high density games)
2x1.5TB 7200RPM std HD's - For media and games
1 or 2 1GB video cards. I think I don't need 2 video cards since I'm not a graphic artist like some of you.

For all the Canadians that use Rogers: Bell FTW

But I like not being throttled

Core 2 Duo E8600 @4.5GHz

ASUS Maximus Formula motherboard
4GB DDR2 RAM
GeForce 8800GT 512MB
~2TB of HDD space (4HDDs)
Windows XP Home SP3/Windows 7 Beta (x64)

Renegade barely drops below a constant 100FPS, even in the largest servers (if it does, which is rare, the lowest I've seen is ~80), at 1600x1200 with full AA, full AF, supersampling transparency AA, and shaders. I sort of need a new video card (not really, but it's what needs balanced the most), and am awaiting the GTX3x0 or HD58x0 cards for that. Otherwise, nothing short of the GTX260/HD4870 would be worth it, as this one still does really good.

A current backup system/internet machine (sold the better backup, gave another away, and yet another is in parts, hence the low specifications of it) is as follows. This is the first system I played ever Renegade on. I'm surprised now that I used to all of the time. It's rather unplayable (due to the CPU), especially on large or even medium servers, or maybe I just say that after being used to anything more.

Pentium III 933MHz
Dell Intel 815 based motherboard
384MB or 512MB SDRAM
GeForce4 Ti4200 64MB
60GB of HDD Space (2 HDDs)
Windows XP Home SP3/Windows 2000 Professional SP4

Internet speed is rated for ~25MB, but the televisions are a part of that. The internet itself is capped ~6Mb download, so I usually get that, minus a little, and between 768Kb-1Mb upload.

It's a FTDD line the university I'm at provides. It's about 10 euro/month for students. Glass-fiber ftw. Only downside is the 50 GB upload limit... And that a lot of servers can't handle the speed. (Actually, speedtest showed much lower numbers when I tried about 1.5 year ago)

So doesn't that mean you share it with everyone else? Or is it a dedicated line?
