Lol MasterEvolution, do you just use your computer like that out of your case like shown in your screenshots?

Anyway here is my Beast(computer)!

At night in the dark

Razer/Microsoft Habu Mouse and Razor Destructor Mat.

Specs...

- 2.4GHz Quad Core (intel)
 - 2.00 GB of RAM
 - 512MB DDR3 Graphics card (GeForce 8800 GT)(PNY)
 - 24 Bit sound card (Blaster)
 - 1TB Hard Drive
 - 350GB Hard Drive
 - Antec Gaming case 900
 - OCZ Stealth Xtreme Power Supply
-

It's been 4 months since my last upgrade...so I'm upgrading my computer from this:

Core2Quad 6600

8GB Ram - PC3-12800+ (DDR3-1600+) DDR3

2x500GB Raid 1, with 750GB Media HD

And a nice motherboard

I'm upgrading to THIS:

CPU: Core i7-920 2.66GHz

Motherboard: ASUS P6T Intel X58 Core i7 Extreme/Core i7 Socket 1366 PC3-16000
(DDR3-2000) ATX Motherboard

Ram: Still looking for a good price, may have to use my PC3-12800+ (DDR3-1600+) until I find some PC3-16000 (DDR3-2000) DDR3 Memory. Motherboard has 6 slots, so i'll be getting 12GB.

HD's: 2x500GB, 750GB Gaming Drive, 1TB Media Drive - Just adding 1TB HD.

Video Card: Probably keep my GTX 9800. Still waiting for better video cards since it's still top of the line.

Ooops, I ment to say "I'm upgrading to THIS:", not the "NOT" part...

I don't think I would ever buy a computer from a manufacturer anymore. I enjoy building my own and being able to upgrade the hardware whenever I want without having to buy a full system. I would have to much hardware laying around, even though I already do.

Going to pass this computer down to my wife, thinking about getting a new liquid cooled case since I've never had one before. Does anyone know if the liquid cool cases are a big hassle? Are they more of pain than what its worth? I'm used to using nothing but fans, and thinking about combining the fans with the liquid cooled system, but it sounds risky when you have any kind of liquid near your hardware!!! My hardware is to expensive to have a few drops of coolant dropping on it....

MasterEvolution, when I took my brother's PC apart and out of it's OEM case until we got a new one finally (the parts inside were custom though), I found it better to have a spot fan on the hard drive. The CPU doesn't need one. Just my feedback from experience. Even though the GPU is old, that's a nice PC. I like how you have it real clean with no dust (which is rare on older parts). Perhaps I should get pictures of his build too (It's an Antec 300 build).

Here's mine. Real pictures? Like these?

Hardware:

Case: Cooler Master Stacker 830SE

PSU: PC Power & Cooling Silencer 610

Motherboard: ASUS Maximus Formula (flashed to Rampage Formula using it's BIOS, since

they're the same thing anyway)

CPU: Intel Core 2 Duo E8600 3.33GHz @4.50GHz

CPU Cooler: Xigmatech s1283 w/ retention bracket

RAM: 4GB (2x 2GB) Corsair XMS2 800MHz DDR2 @5-5-5-18 900MHz (had 8GB, as shown in the pictures, but it forced me to use 4.0GHz and higher voltages, and since 8GB is massive overkill, I took it out)

GPU: MSI nVidia GeForce 8800GT OC 512MB

HDD: 4x 640GB Western Digital Caviar SE16 AAKS

Monitor: IBM P275 21" CRT 1600x1200 @100Hz

Speakers: Logitech Z2300 2.1

OS: Windows XP SP3 & Windows 7 x64 BETA (will get Windows 7 x64 Home Premium upon release)

I started buying the parts in November of '07, and finished it near the beginning of February (waited for the E8400 to launch), so it's a little over a year old at this point.

The PC was turned on, and the fans were spinning in all pictures, even though it doesn't look like it. It's the motion detection of my camera. I included three using the camera in manual mode so you can see what it actually looks like, but they're blurry since sharpening and all that was off.

Ten picture limit per post, so the rest are continued below.

Oh, and just for the heck of it, here's an older PC. It's a Dell Dimension 4100 with a Pentium III 933MHz, 384MB of PC133 SDRAM, a GeForce 4 Ti4200, a Sound Blaster Live Platinum, and a 40GB HDD. It has Windows 98SE and Windows 2000 on it (Windows 98SE FLIES on this thing). It's older, sure, but it was one of my first PCs I really started tinkering with, minus the one before it that I killed. It's also the first I ever played Renegade on. I haven't been able to part with it.

What keyboard is that you have? It looks nice (but it's hard to tell since the photo's are a little noisy).

I like the Antec 900 too. My brother really wanted a case with a window, but I was hesitant let him get some real cheap off brand junk just because it had a window, and the Antec 900 was more than I wanted to spend, so we went with the 300 for a little over half the price the 900 would had cost. It was an excellent case for the money, and him and I had no problems with it when assembling it. I imagine the Antec 900 would be even better.

@Mr. Selfish, that's a nice bundle, but the images are way too big. Nobody wants to see images the size the camera takes them at. I was thinking maybe mine were too big after seeing the OP's, but they're only 1024x768.

The keyboard is the Saitek Eclipse II. I got the Antec 900 case about a year and 5 months ago I think; absolutly brilliant.

For scrin's screenshots I had to zoom out to see the photos, maybe Scrin can post photos of his actual computer set up on the desk?

I used to own a really old computer but decided to get rid of it. I also have a laptop, it is a dell vostro 1500 and it really has a crappy GPU but it work really well for renegade and AOE.

I also wanted a case with a window but the case costed like 89 dollars so I was just thinking to leave it out like so. Anyway....I wish the cables on the power supply and the ide cables were longer the y are to short so they don't all fit together nicely.

My hardware is to expensive to have a few drops of coolant dropping

on it....

Have had it for like 4 years or so, but since summer 2007 I decided to drop it. Coolblocks and parts are pretty expensive, and if you tinker a lot to your setup, then you need to recheck your watercooling everytime you change something. This because a hose or w/e might have moved and decided that it would be funny to drown your hardware.

I've had a couple of times in which the system did start to leak, and only one of those times any hardware failed. That just happened to be a at that time very expensive Geforce 4 Ti4600 Eitherway, if you got the money for it, and don't mind spending a day tinkering to get it tested and running, than watercooling is great.

It's very quiet and still cools like a charm. Got a TRUE 1336 RT on my core i7 920 right now, but it still isn't that quiet. Might however be my GFX as well (ATI HD4870 1GB OC edition). All this in an Antec p182b

EvilWhiteDragon wrote on Sun, 05 April 2009 12:14Speedy059 wrote on Sat, 04 April 2009 05:01Ooops, I ment to say "I'm upgrading to THIS:", not the "NOT" part...

I don't think I would ever buy a computer from a manufacturer anymore. I enjoy building my own and being able to upgrade the hardware whenever I want without having to buy a full system. I would have to much hardware laying around, even though I already do.

Going to pass this computer down to my wife, thinking about getting a new liquid cooled case since I've never had one before. Does anyone know if the liquid cool cases are a big hassle? Are they more of pain than what its worth? I'm used to using nothing but fans, and thinking about combining the fans with the liquid cooled system, but it sounds risky when you have any kind of liquid near your hardware!!! My hardware is to expensive to have a few drops of coolant dropping on it....

Have had it for like 4 years or so, but since summer 2007 I decided to drop it. Coolblocks and parts are pretty expensive, and if you tinker a lot to your setup, then youy need to recheck your watercooling everytime you change something. This because a hose or w/e might have moved and decided that it owuld be funny to drown your hardware.

I've had a couple of times in which the system did start to leak, and only one of those times any hardware failed. That just happend to be a at that time very expensive Geforce 4 Ti4600 Eitherway, if you got the money for it, and don't mind spending a day tinkering to get it tested and running, than watercooling is great.

It's very quiet and still cools like a charm. Got a TRUE 1336 RT on my core i7 920 right now, but it still isn't that quiet. Might however be my GFX as well (ATI HD4870 1GB OC edition). All this in an Antec p182b

Perhaps you should consider the water cooling system as an investment, the more you pay, the more reliable, kind of a thing.

R3 does bump:

This is Eve 2.0.

I apologize for the bad quality of the photos, but the DSi's camera isn't really made for quality.

Specs:

Processor: Intel Core 2 Duo E6600 (2.40GHz)

Motherboard: MSI P7N SLI Platinum (NVIDIA nForce 750i chipset)

RAM: 4GB (Only 3GB allocated because I run a 32bit OS)

GPU: NVIDIA GeForce 9800GT (1Gb)

Hard Drive: 500Gb internal, 500Gb internal, 250Gb external. Total space amounts to 1.2Tb.

Optical Drive: Two LG 22X DVD±R DVD Burners

Interface; Microsoft Wireless Comfort Keyboard 1.0A, Microsoft Wireless Optical Mouse 2.0,

Bamboo Fun 5.8" x 3.7" Drawing Tablet.

Monitor: Westinghouse 19" LCD

Power: 600W

Chassis: Cooler Master HAF 932. Modified to use a total of 7 fans, not including my graphics card fan, processor fan and power supply fan. (With those, it totals 10 fans)

Audio: Logitech X-230 32W 2.1 sound system. (I should be getting my new G51 Speakers sometime in the next week. I ordered them 2 days ago.)

OS: Windows XP SP3 (32Bit)

Images (again I apologize for quality):

I can't be bothered to open up the case. Besides, the image quality would just make it hard to see what everything is.

And yes, the DSi is the only form of device that can take digital photography in my house.

Looks pretty cool with no lights, tubing is UV reactive so it glows.

EVGA 780i
E8500 @4.0
8gb 1066mhz Corsair
3 x 8800 Ultra's
30gb OCZ Vertex
250GB Seagate
Corsair HX 1000
