I installed Renegade first, then copy over all the custom maps (i play on UN server). After that, I downloaded RG 1.0323 installer from the site. Installed that, and opened "game.exe". It only took about 5 seconds to download something, then it closed, and re-opened(there's something wrong with it, I know it should take awhile to download CP1 on its own).

I don't know why it didn't download and install CP1 automaticly, and when I try to manually install CP2, I get the "old file not found" error. I then checked my register. Under HKEY_CURRENT_USER\RenGuard, there's the entry "PatchVersion = 2". So it means that CP2 is already installed. But when I try to run Renegade, it still asks for CD to be inserted (I know CP2 comes with TFD's nocd patch, so there's also something wrong).

I've been doing this for 3 times... And I can't figure out what's the problem.

btw, since when does RG installer look like this?

I don't recall it's been this "simple".

I would recommend the no CD patch...But that would be my trial and error method of solving problems, so are you running renegade with compatability for XP?

Doesn't that installer look like the Renguard server side installer?

Lol you have to download a ZIP file to get to that. No it is the same as the client installer.
