Okay so I have this problem that when I make some meshes connect, how do I get my blending to look better? I am also using 3ds max aswell.

First of all use UWV Map on your meshes so they tile up right.

I did and that is what I got.

Is that one plane? Or do I detect multiple planes?

You should just use one plane with alpha blending which should work perfectly.

It was one plane but I dettached part of it and made a tib field. So it is two planes.

a method is to attach them (the planes) again and weld the vertices, then apply a new UVW map
did you use plane ore box whit the uvw map?

So the attaching worked fine and so did reapplying the UVW map to the whole mesh but with export I got this problem:

Delete all of your Renegade Materials and start again or try and find any reasons within the materials' settings the exporter is complaining about. Possibly one of your meshes has too many passes?

Alternatively you could have placed the gizmo for every one of the UVW maps at the same coords (expand the UVW map modifier).

oh yea, forgotten to tell you that

If you attach planes, there materials must have the same amount of passes.

so, what I am saying is that you should make a other pas on your ground terrain.

So can I make another pass, but not add a texture to it?

You can keep your meshes separated. Texture them individually. Next select all meshes, and apply an UVW map to the selection.

What i always used to do was just texture everything with the exact same texture on pass 2 and use pass 1 for all your different materials.

Then when it comes to vertex paint, instead of putting it around the edges, put it in the middle avoiding any of the very edges of any mesh. Then re select every single mesh and redo the uvw

all at once and it should be perfectly seamless.
