Subject: [RenX] Possible to level a selected area?

I was wondering if it's possible to somehow level a selected area (0.00, 0.00, 0.00) in order to insert your base. I finally can use RenX again now that I have it installed on my laptop - my desktop encountered a registry error more than a year ago and I couldn't use the program anymore and so my practicing came to an abrupt stop. Things are fuzzy as I pick up from where I left off, so I could use some help.

Select the area you want to level out, use the scale tool and decrease the scale on the Z-axis until its looks flat.(to get the non-uniform scale option, hold down the scale tool's button till you get more options, then pick one of them. Lastly set the Z co-ordinate to 0, or whatever level you want.
