What do you mean exactly?
Do you want a red alert 1 en tibdawn that can be installed and run on a 64bit computer?

Or a 64bit version of the games?

The biggest problem is installeing the games since I believe they use a 16bit installer which just wont run. There is an easy trick, just install the games on a 32bit machine(pref not vista)then copy the total install over to your program files(x86) on your 64bit machine. That should do the trick there is also a trick to play cnc95 and ra1 over lan with that pc.

http://www.understorm.net/

I know you wont have the game on the pc's register but I doubt cnc and ra1 are doing much with that.

like reaver said its has a 16 bit installer since it was made for windows 95. try extracting the game manually then run it as windows 95.

You will need a very good pc to emulate the dos protected mode.
