hey

a server I successfully hosted renegade DEMO server on in the past on was decided moved to full version, here it comes up on the gamespy serverlist, but its not possible to join it. ..it just hangs on "joining game".

its the exact same serverfiles as used on many other windows (full version) servers where these files works perfectly fine.

it still works well to host renegade demo on, both appearing on gamespy list and is joinable..

using default ports as on all servers (which is same as the demo version-) udp 4848 & 25300. also tried other ports without luck.

they are clear to use and getting bound nicely when I launch the server, dunno why I can't connect thru it with fullversion?

25300 seems fine, coming up on gamespy serverlist and all.. just can't join it when using the full-version server files.

anyone got ne idea whats up with it?

any help appreciated.. thanks anyways
