[View Forum Message](#) <> [Reply to Message](#)

I just wanted to know if you could take the w3d files for one character of Ren then rename them to replace another.

Like for example, if I wanted Locke as one of the Havocs... Could I just extract his w3d files and rename them as the snow or desert Havoc?

And if the above worked would I be right to assume I would need to do the same for the DDS files?

Thinking even further if those two ideas work... Would it be possible to have the name changed to show that it was Locke instead of saying it was Havoc when targeted? This one I don't much care about, if it was not possible or too difficult.

Edit the Havoc preset file and change it's model to that of Locke and the string name to Locke

cnc95fan wrote on Fri, 16 October 2009 17:10 Edit the Havoc preset file and change it's model to that of Locke and the string name to Locke

Where would I find this preset file?

Where would I find this preset file?
It's in LE but you are then modifying the objects.ddb therefore you can't play online.

EDIT: Unless you make it a PKG.
Anyway you should be able to use it somehow without modifying presets. Just look at the custom

characters already around for example ^^

[View Forum Message](#) <> [Reply to Message](#)

So changing presets is out of the question (for me at least)...

Would the way I put it work, where I would just change w3d file names and place them in my data? I would assume they would but I don't do models, so I don't know the way these work.

[View Forum Message](#) <> [Reply to Message](#)

After digging through my XCC mixer these are the w3d files that I found.

Which of these are the files used for online? I tried to rename the locke files to the havoc ones, but when i go to buy the desert havoc it crashes my ren... I also renamed the locke DDS file to the desert havoc one assuming I would have needed to.

Anyone have any ideas?

I don't know much about character models, but I think they are all used.

I think the "L" (as in L1, L2, L3, ect) stands for "level" or maybe even "load."

I think each of those models are different detail levels. In Renegade, units have a LOD that changes the detail of units based on how far you are from them. The further you are, the less detailed they get (thus less the computer needs to process.)

After going and downloading some other models people have released I see that they only used the c_ag w3d files... but I already tried just switching those and no still got crashes.

I think because the W3D engine knows what the file actually is (other than just the name.)

I think it looks at file size and actual content, instead of just names. So simply replacing the name of a model or something would result in a miss-match and a crash.

Textures are probably the exception to this rule. WW probably intended for that, however.

im not sure, but i would say open the "Locke" char with RenX put textures on it and save it with havoc model name? i think this should work, or?

Subject: Re: Another dumb question from me.
Posted by [ChewML](#) on Sat, 17 Oct 2009 04:49:09 GMT
[View Forum Message](#) <> [Reply to Message](#)

RenX is part of the problem... I don't have it installed atm, because the last 10 times I have

installed it I didn't figure it out... lol.

I just figured with both the w3d files coming from Ren there wouldn't be a need for some conversion, but that is why this thread is called "another dumb question from me".

Textures are probably the exception to this rule. WW probably intended for that, however. indeed, BUT if you hex edit it "rename it from inside the file" the it will work. Open c_ag_locke in a hex editor and change all the "locke" values to "havoc"
EDIT: will have to correct myself. DO NOT CHANGE THE locke.DDS VALUE to havoc.DDS, unless you have a custom skin and want it to affect only the character you are hex editing. IN that case change it. But keep in mind the character count of the file name has to be the same

I downloaded this other program before the other 2 suggestions were made... seems simple enough, just hope it is the right type...

So this is what I have.

What part of these files should I copy paste over, and what part should be left alone for the DDS file?

Ok, so I have tried it every way I could think of... but it still crashes...

So if someone would please edit the files for me but take a SS to show the difference I would be very grateful.

I only ask because it sounds easy enough, but I am a n00b.

Just to make sure everyone is clear on my goal: I am trying to make it so General Locke replaces the desert Havoc.

Here are the files to save some time.
