I am under a connection through DSL through wireless adapter and the computer connected directly to the adapter(the one i use the most) has issues loading a page (showing "Oops! this link appears to be broken" or the page could not be found) this is fixed sometimes after refreshing once. On the other hand some pages take 10+ times.(LITERALLY) When a computer/My 360 is connected trough the adapter Wireless it runs perfectly find no issues with lag(360) or the broken link or page could not be found.(computer)Anyone know why this is happening? Is more information needed to help?

Edit: I use google chrome, have tried clearing cache and cookies, and know for a fact the sites are not down.

I get something quite similar. A refresh of the page usually fixes it, and it's no problem.

I've had it once where it took a few hundred clicks to get the page, so I know where you are coming from, but it's probably not too common to be a big deal.

Altzan wrote on Wed, 10 March 2010 21:12This sometimes happens at our school. Unfortunately I have no idea why it happens
  maybe the interwebz is failing

but on a serious note.....! there is obviously not an answer to this and probably never will be therefore my laziness cannot win this time...

Take your internet, and put it in the microwave for about 30 seconds.

You need to turn the DNS Client service on.

Windows Key + R

msconfig

Tick DNS Client

Restart computer

Then do ipconfig /flushdns in CMD.

Subject: Re: MORE internet issues

Caveman wrote on Fri, 12 March 2010 08:12You need to turn the DNS Client service on.

Windows Key + R

msconfig

Tick DNS Client

Restart computer

Then do ipconfig /flushdns in CMD.

When you follow these steps and are looking for the tick box for "DNS client", you need to select the Services tab, by default you'll see the General tab.

Sladewill wrote on Fri, 12 March 2010 19:15What wireless adapter have you got, as in strength it might be overpowering what your router can take.
This one:

Model: WRT160N V2

If any more information is needed tell me

Just a thought: Have you tried checking the ethernet cable for damage or swapping it for another cable for comparision? I am assuming from your first post that the problem is with a computer using a wired connection, while devices connected wirelessly are working properly.

It could simply be that the ethernet cable is damaged or faulty and therefore the DNS packets are not always getting through. You didn't mention whether you experience intermittent problems with other online activities (such as gaming etc) on the computer in question, these would also be symptoms of a faulty cable and if you DON'T have them then this is almost certainly not the problem.

I haven't tried another Ethernet cable when i find a ride to a store I'll buy a different one (terrible how we don't have spares in a household that keeps all wires/cords for later use)

As for problems i have noticed:

Starcraft-Cant host due to latency

Renegade-normal ping is 64 but recently has been averaging at 100-200 causing lag (in any server i have joined)

Youtube and TBS-videos will not load correctly/load slowly

It could be your ISP's fault because they are updating something. I had similar issue when tiscali was bought out by talktalk, it was slow for quite some time...

It wouldnt be this, his other computers which use the same internet connection aren't experiencing any problems.

I doubt its the Ethernet cable but its always a possibility. Didnt your 360 come with a Ethernet cable?

Try updating firmware/drivers.

yes but its not long enough
i think he means the one from the router to my comp
my firmware/drivers are fully updated....

Yeah I know, But couldnt you move the router/computer closer to each other so you can test out the Ethernet cable theory? Saves you spending money on a new cable when it might not be the problem.

To do that i would have to completely move EVERYTHING aside from the monitor... and that's really a pain in the ass.... besides i borrowed one from a friend to test it... i'll get back to you when i do

Edit:
Parents attempted cheap fix... in the end its WORSE for one thing I can no longer favorite/add videos to a playlist on youtube... can no longer upload images on imageshack and now i have to refresh MANY MORE TIMES to get any website to load... cleared cache, cookies, history, downloads etc... also now it takes multiple attempts(last time it took 14 attempts) to get into WOL. and now even renguard wont connect

(i will now in SOME posts add the amount of refreshes it takes to post the post)
