Is a skin really necessary? I managed to create one for a tank I made but it doesn't look nearly as good as it does when I just texture each part plus it took a long time to make. Is there a point to it?

Thanks.

I'm assuming you mean having a single uniform texture over the entire object as opposed to different textures on each part of the object. It's actually a lot faster to just have one texture while loading and rendering an object. Using multiple texture maps also slows down the video card as it has to stop drawing, load a new material and then draw a new batch of triangles.

tl;dr - You'll probably get more FPS if your object uses just one texture.

it all depends, because if you are using custom textures, (not in the game data folder) then you will need to add them as well to the data folder if you ever plan on sharing the moddle.

however depending on skill level it is easier to texture each object individually., which brings up a question I have had, how do you make skins for created moddles?

ya doing the skin thing or having like 5 separate textures, I'll include a screen shot. I guess I get what your saying for best fps I should just use 1 texture (a skin) thanks for the info. I will keep messing around wit the skin and try to get it right or maybe I'll just give up. -what a pain in the ____
