hey i tried cloudy serve and it dont evan have a install file

nighregulator when installing fails to register a dll
and when i ignore and open nr it says corrupted nrconfig.ini - radar

and brenbot i dont know what the hell is wrong with that i install and when i click to run it it opens
and closes in 3 seconds says something like renservr.ini missing i put one there but nothing
worked

any ideas to fix these

BTW i running it on windows server 2008

Follow the instructions in the BRenBot readme file to point it to your FDS installation so it can find
the server.ini in that location.

A) Are you running the NR installer as admin?

B) Can you post your svrcfg_cnc.ini and your server.ini in your FDS directory? (remove any
passwords/serials of course)

What appears to be happening is... your have a perfectly valid server.ini in your FDS dir... and
RenegadeServer.exe exists so its accepted it as a valid FDS installation.. but then when it tries to
import the configuration file the radar is set to something other than 0, 1 or 2 and it shits itself
because something is TERRIBLY wrong Since the FDS shouldnt even load like that. Admittedly
NR should probably silently recover rather than shit itself.. but thats whats causing the problem
The error catching module is not loading untill later on in the boot up which is why NR simply shits
itself lol.
