i fallow the renhelp tutorial but i get confused cause the one who maded explain how to merge weels bones of the mammoth tank thas does not even exist: WheelC01R.00, wheelP01RL.00, WheelP02R.00.

wen i try to merge this files from mammoth model i cant find them, there a lot of weels but no the ones i write above, anyone knows what are the right ones i must merge?

The mammoth tank has tracks and therefore has different bone names to a vehicle which uses wheels like the Humvee. The documentation that comes with LevelEdit explains the difference and how to use each type.

`\see RenegadePublicTools\HowTo\Vehicles\How to Construct a Renegade Vehicle.htm`

`\see RenegadePublicTools\HowTo\Vehicles\Vehicles.doc`

So you like observing perversion? Isn't that the same as watching fetish porn?

I found this tutorial to be extremely helpful.

I almost forgot about that tutorial Gen_Blacky. I remember you gave me that link a while back and it was indeed helpful.

Ftw, why stop there we should also mention wire animation.

Here is a two part video tutorial:

Part1 <http://www.youtube.com/watch?v=x5isvIAu6T8>

Part2 <http://www.youtube.com/watch?v=7QwB4ZFejQQ&feature=related>

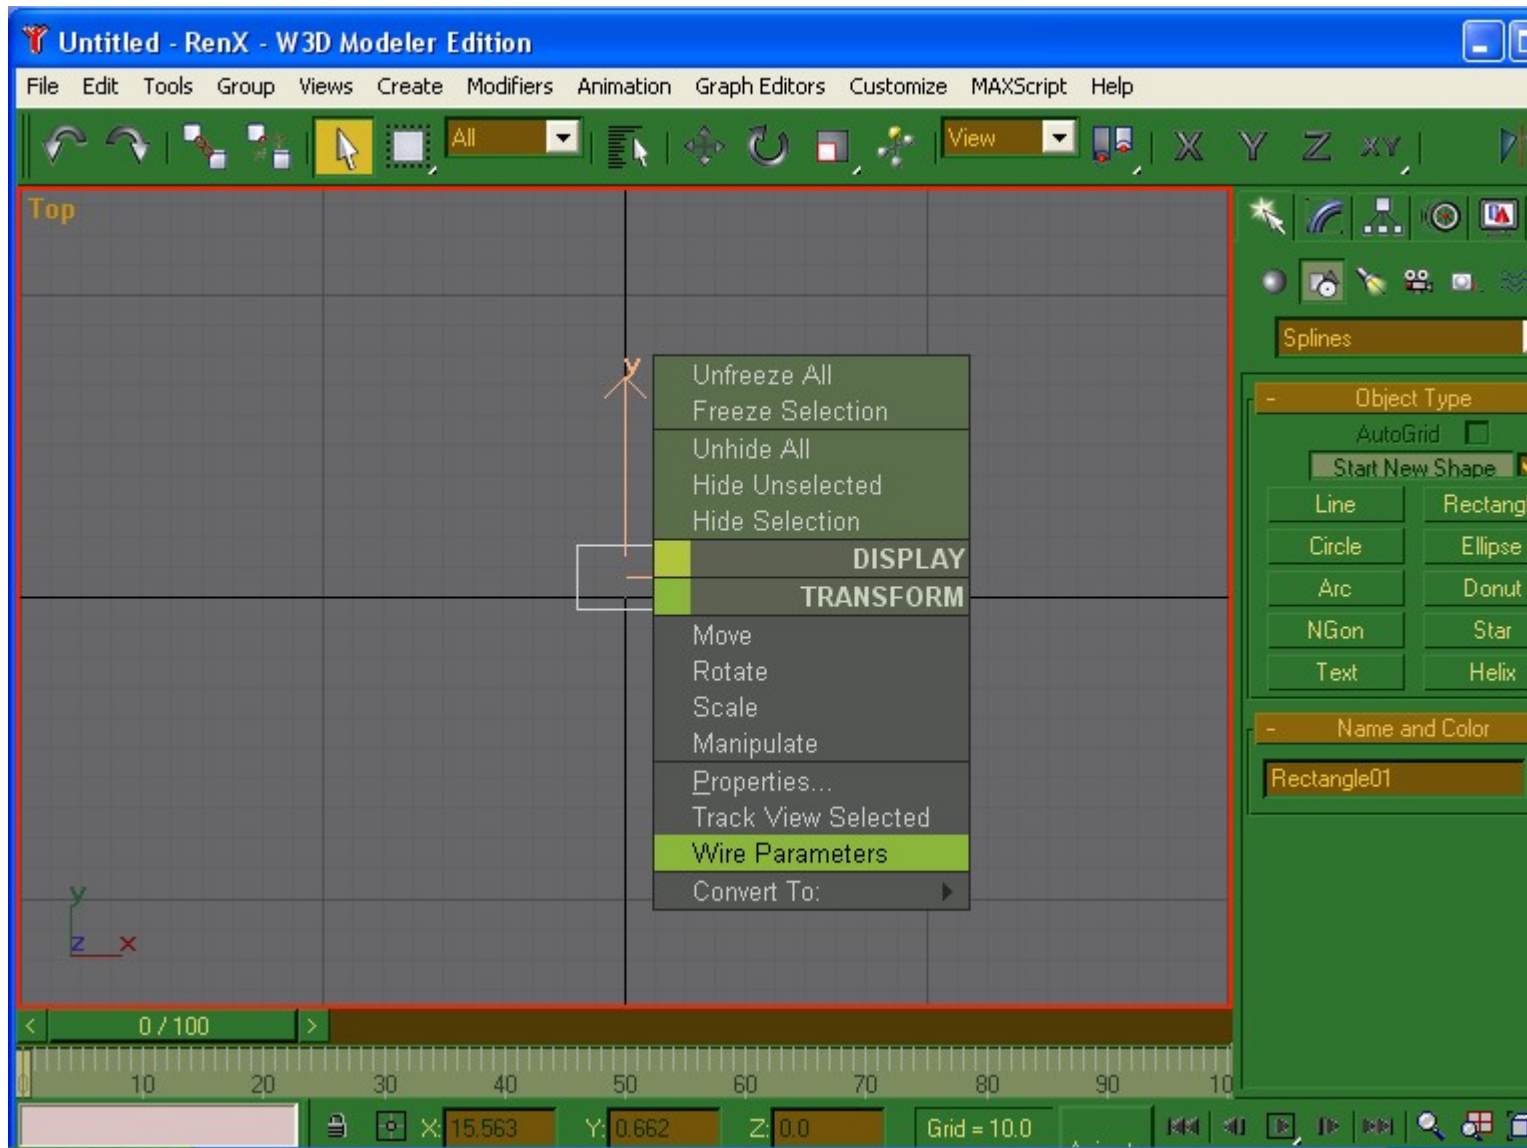

The tutorial was done in 3ds but you can do this in renx by manually assigning the controllers to your object's via Track View.

A bunch of renx screen-shots as to how to assign the controllers:

Edit: I should mention you don't have to do it the same way as he describes you can connect each wheel's rotation individually with the object that uses the position controller.
