hi, i recently installed directx9 on my system and when i went to go play renegade it was all dark in the game. so i went to the video settings in the game and tried to up the gamma correction. the sliders no longer work. there are also 2 below the gamma slider and they are non-functional as well. my system is a win2k sp2, gf2 gts 512mb 1800+ XP. the sliders worked fine before upgrading to directx9. i tried uninstalling the game and then reinstalling everything and that still didnt work. it is virtually impossible for me to see anything in the game because of this problem. i did upgrade my video drivers to the latest nvidia has to offer and this still does not fix it. any help would be greatly appreciated.

Does the brightness look fine in Windows ? If not adjust the settings there. My config is similar to yours and I also recently installed DX9 w/no issues.

I also use Win 2k (but SP3 instead of SP2) you can see my other info in my sig. Win2k SP3 replaces a lot of files so I'd suggest the following :

- A) Uninstall Renegade
- B) Reboot
- C) Get SP3
- D) Reboot (duh)
- E) Reinstall Rene
- F) b0ink n00bs

Hope this helps...I'll browse around (maybe) and see if I can find some info for joo.

Good luck,

The One
