Posted by [iRANian](#) on Sat, 17 Sep 2011 10:35:51 GMT
[View Forum Message](#) <> [Reply to Message](#)

The code for this plugin is ported from the OnOeS source code written by Hex, jnz and pvtorschlag. I started porting this plugin while I was reading the OnOeS source code and had need for GSA support without having to install the RR server or starting BRenBot. I know there are many alternative software that can do this, but it was a relative quick port and I know some people might need this or be interested in it.

This SSGM 4.0 plugin adds GameSpy broadcasting/listing support to the FDS, like WOLSpy, Renegade Resurrection and BRenBot among others (can) do. The configuration file allows you to configure all the non-essential information sent to the GSA master server, such as info about whether friendly fire is enabled or not. You can also send out custom information such as the name of your (community's) site. All the player info is sent, such as kills and game time.

To install:

1. Copy GameSpy_Support.dll to your main FDS folder, where SSGM is located in.
2. Open up ssgm.ini in the folder and add an entry under [Plugins] for "GameSpy_Support"
3. Add the following text to SSGM.ini and edit it to your liking:

Toggle Spoiler[GameSpy_Support]
; Configuration for the GameSpy_Support plugin

;What port to listen on for GameSpy queries/packets
;NOTE: DO NOT set this to your FDS' port
;And make sure the port isn't blocked on any router or some crap
ListenPort=1339

;The name of the server's game mode
GameMode=AOW

; Keep this zero to use the actual maxplayer amount
; This setting is useful for custom max slots
MaxPlayers=0

; keep this zero to use the WOL game description/title, or set this to a

custom
;game title
CustomGameTitle=0

;What 'time' info to send out for players.
;Set this to Total or Gamestart
;Total sends the total time a player has been ingame
;Gamestart sends the time players have been ingame since the start of the map
PlayerTimeMode=Total

;Append the player count to the WOL game title?
; e.g. Derp Server (0/40)
NoWOLAppendPlayerCount=true

ShowGameMode=true
ShowDriverGunner=false
ShowTeamChanging=false
ShowFriendlyFire=false
ShowCredits=true
ShowTimeLeft=true
ShowPedestal=false
ShowRotation=true

[GameSpy_Support_ExtraStrings]

;Note that if there are too many strings listed here (say more than 50) it
;will cause a buffer overflow/crash
;Example: 01=Website\www.herpderp.su

01=Website\www.herpderp.su
02=Bot\BRenBot
03=IRC\irc.jelly-server.com

I'm releasing a new version, it fixes an issue where the server stopped appearing on GameSpy at high player counts for some people because the Winsock sendto() function fails to fragment UDP packets properly. It also fixes a weird, rare issue where the FDS gets spammed by error messages because the FDS receives weird packets from gamespy.com for no apparent reason.

It's recommended to update, this new version fixes all known issues with the plugin. I'd like to thank st0rm.net for helping me test this version and I'd also like to thank StealthEye for helping me find the issue with Winsock and for suggesting a work around. See the first post of this topic for the updated version.

I released a new version that adds support for passworded games. Download it from the first post in this topic.

Thanks to Caveman for reporting the issue of the missing passworded games support.

[View Forum Message](#) <> [Reply to Message](#)

I'm releasing a really small fix for a line where I zero out 8192 bytes of a buffer when that buffer only allocates 4096 bytes, for some reason that doesn't appear to cause any unusual problems :/, but it's nice to have fixed.

This plugin has been running on a bunch of servers for a while now and as I haven't had any new bug reports I assume that it's stable.

Thanks to Whitedragon for reporting the issue.

Hasn't fixed it either m8. I compare my server name to others who have the thing working for them and my server name is shorter so it should fit... Don't know what it could be :/

Edit: Nvm, now it seems to be working. Does it take someone to join to do that or does it have to load up later or something?

[View Forum Message](#) <> [Reply to Message](#)

It seems to update the settings on GSA quickly, rather instantly. It just seems like the only thing

delayed a bit is the XWIS Name Append thing that iRAN did which is obviously good, but it's about a minute delayed on average.

iRAN, is it possible to update the playercount on XWIS to include GSA players, somehow?

Subject: Re: [SSGM 4.0 Plugin] GameSpy Support
Posted by [iRANian](#) on Mon, 04 Jun 2012 13:21:38 GMT
[View Forum Message](#) <> [Reply to Message](#)

The reason it's delayed is because XWIS takes ages to update the topic title.

Yeah it's possible but it'll require lots of work and I'm not sure it's allowed by Strike-Team.

It's not hard, that's for sure. We had it in some form of WOL proxy. Yes, WOL proxy, not XWIS proxy. It made our server visible on both the USA and the EU WOL server, and worked to some extend with playercounts. Was quite a dirty hack that we used, but we never ran into problems with it, amazingly.

How? I assumed since WOL/XWIS is essentially an IRC server that it got the playercount from the amount of users in the server's channel... which I assume can only be legitimate registered users on a valid serial?

But of course I could be wrong on all of that.

I believe Ethenal is correct, in that the amount of players displayed as in-game on the WOL listing is based off the amount of clients in the FDS's channel.

However, there are no doubt ways to work-around that.

You described exactly what we did. We made it have registered users in our channel. Not the ones that were ingame, but that wasn't visible from the serverlistings nor when you were ingame nor in the start screen.

If it's achieved by spoofing clients in the FDS channel, then Olaf would quite rightly be annoyed, and potentially ban your FDS.

Bots on WOL/XWIS are not allowed (although it's something that isn't often enforced).

What he said - plus that if everybody was doing it, then they'd be FORCED to block it. It's not such a big deal if one random community is doing it because it's probably not even noticeable.

Your router must be blocking it or you don't have the right port defined in the ssgm.ini.

I'm running beta 5 and my server shows on the gsa list with no problems.

there is no need for an up date.

You can contact me via TeamSpeak either on mine dsts.us:3369 or on ts.MultiPlayerForums.com, I can help you set it up right.

What he is saying is that dedicated server boxes (i.e. one hosted in a colocation center, like SoftLayer in Dallas) do not HAVE NAT routers. So therefore, what you're talking about has nothing to do with his problem (unless of course his server is behind a NAT router at home or something similar).

Posted by [iRANian](#) on Sat, 01 Sep 2012 21:21:58 GMT

[View Forum Message](#) <> [Reply to Message](#)

I've uploaded version 1.4, Animoski reported that both his main and test server crashed at the same and that the FDS didn't generate a crashdump, which likely means it crashed in the GSA socket thread code from this plugin, he suspected the reason it crashed was because the connection with the GameSpy master server was lost.

This plugin checks for socket errors the way Microsoft's documentation describes, but receiving data on a closed socket isn't considered an error, it will cause zero bytes of data to be received instead of an error being "set". My plugin didn't check for this because it's fucking retarded to design a function like that and this design wasn't highlighted in the documentation.

The update adds code to check for this and another data corruption case, but I'm not sure if it fixes this of crash which I'm not certain if it was caused by this plugin (although it seems very likely).

Released version 1.5, this version should fix an issue where sometimes the real player count is appended twice to the XWIS game title.

Also changed the code so it's a bit more efficient, although you won't notice this at all. I'm using code from Whitedragon that hasn't been publicly released (yet).

Don't know what is wrong but it shows up in RenList like in the attached screenshot.

Might be fixed with a newer BRenBot release though, it only seems to affect a few servers listed on GSA now.

File Attachments

1) [renlist_unitled.png](#), downloaded 380 times

The screenshot shows the RenList v1.0.5 application window. At the top, there's a menu bar with File, Options, and Help. Below the menu is a toolbar with buttons for WOL and GSA. The main area is a table with columns: F..., IP:Port, Game name, Map, Players, P..., and Ping. The table lists various servers, including Kambot/KamuixLite AOW, Tiberian Sun: Reborn Testing, UltraAOW.com Test 4.1, and several servers from Jelly-Server.com and Turbo-Technologies.us. The row for '64.85.165.123:8787' is highlighted with a blue border. Below the table is a smaller table for connection options with columns: Option, Data, Player, Side, Score, Kills, D..., Ping, and Time. It shows entries for ded (1), dg\ (password), 0 (TC\), and ff\ (SC\). At the bottom of the window, there are 'Connect' and 'Refresh' buttons, and a status bar showing 'GSA: Total servers: 51 - Available: 48'.

Oh yeah, I do recall there was an issue escaping blank values which I fixed a long, long time ago... unfortunately servers aren't particularly quick to update their bots. I assumed it must have been something more recent than that.

Thanks for getting back to me though.

I also find it quite amusing that the TSR servers are listed in there... we only have GSA turned on for our own launcher to talk to, I had no idea they were showing up on renlist.

You guys are using your own GSA master server clone?

Clearly not, because Reborn servers appear on RenList.

That's why I was wondering. Might also mean it's broadcasting on the clone and on GSA.

Figured they just filter on servers hosting with a map with RA_ or TS_ as prefix.

no, we use the gsa query/response mechanism to feed game info to our launcher clients, which send UDP queries to servers listed in an XML file. we piggy back the gsa support built into brenbot to avoid the need for any additional server side code... its meant to have the actual broadcasting turned off, I'll have to look into that.

iRANian wrote on Tue, 19 June 2012 18:48Uhm, it shows up in GameSpy Arcade and RenList just fine. I can't tell what RR is doing wrong without the source code although I could disassemble it I guess if I feel like. Try adding 'csvr 1' and 'dg 1' to the info sent. That shoudn't work because BRenBot sends those out incorrectly.

I fixed that issue before also. Most servers would of had it.
