Hi,

I just uninstalled renegade to have a fresh installation with scripts 4.0..

So i followed the steps below..

1. I reinstalled renegade..
2. I applied the 1.037 patch..
3. I installed scripts 4.0 according to whats told on "4.0 Installation Guide" thread on st0rm forums and finally installed renlist and configured it as told on the same thread..

So i just joined a server and the problem is..

My keyboard and mouse are completely disabled in game.. In this situation my only resort happens to be is to press win key on keyboard, goto desktop and close ren via task manager's end task feature..

Can u help me fix this?

Thx..

If you run Renegade without renlist, do the mouse and keyboard work in the menus?

Contact me on the St0rm Forums I know how to fix this problem. As I have done it for 5-6 people now. Its quite easy to fix.

Regards,

Tiny.

Or you explain it here so other people can make use of your solution as well. Besides TT being able to fix/prevent this in a next update.

I think it's because input01.cfg cannot be found. Copying that file from Renegade/data/config/ to My Documents/Renegade/Client/ probably fixes the issue. Is that also how you fix it, Tiny?
