As I said above, Norton will sometimes delete tt's game.exe, I say sometimes because I didn't have it happen till I reinstalled everything onto my new hard drive. I had to manually go into history and restore the file.

Can you find some logs on this, does it say what the reason was for removing the file?

I stand corrected; it was actually deleted on my laptop, thus its Symantec Endpoint Protection's Proactive Treat Protection that deleted Game.exe.

As you can see it marked it as a Bloodhound.Sonar.9.

The screenshot shows the Symantec Endpoint Protection 'View Logs' window. On the left, there is a sidebar with options: Status, Scan for Threats, Change Settings, and View Quarantine. The main area displays 'View Logs' and 'The logs you can view are listed below.' Below this, there is a section for 'Virus and Spyware Protection' with a shield icon and the text 'Protects against viruses, malware, and...'. On the right, there is a 'Proactive Threat Protection Logs' window with two tabs: 'System Log' and 'Threat Log'. The 'Threat Log' tab is active and shows a table with columns 'Filename' and 'Risk'. The table contains one entry: 'game.exe' with a risk level of 'Bloodhound.'.

| Filename | Risk |
|----------|-------------|
| game.exe | Bloodhound. |

Does Norton ever actually delete anything malicious or does it just randomly delete files for a laugh? I think Norton is worse than malware sometimes...

Considering the one time I used Norton Internet Security it broke my internet access completely, you might be right.

Norton is sux, very sux. its detects random user files and says that is virus to impress you.....

better get something else.. who is not stupid like Norton.

very funny is that ONLY Norton has that type of virus...

i searched on google and i found only this page....

That's not really "very funny" because that just seems to be how they named their algorithm for finding trojan horses by behavioral analysis. I'm sure other companies do it too, but just name it differently and probably use their own algorithms to do so. Since it's analyzing behavior and attempting to find viruses even before they are analyzed by their staff, it's not too strange that it sometimes detects innocent programs as being viruses as well. I'm sure other solutions also do that, and it's probably mostly caused by the code injection and such we need to change Renegade. That may appear irregular/hostile.

Having said that, I have almost only heard bad things about Norton's virus scanner, so I wouldn't recommend it either. Nearly all virus scanners are in that category for me though.
