Basically on this PC, I've tried using 4.0 before and had issues in the past, but I figured since the new release I'd give it a bash again - but I'm still having issues.

I can successfully join any server, but the FPS drops to 0 and freezes, only using 3rd person. It's fine I keep the game in first person but as soon as I switch to 3rd person it freezes, no crashing meaning no crash dumps. Any ideas?

Update: When using first person, it runs for about 30 seconds and then freezes, freezes immediately.

Just installed a clean copy of Renegade and installed TT, same issue. Not sure if it's a hardware or software issue but something is obviously incompatible.

The Question would be what happens to the other stuff in your PC once they drop to 0... Like do you get 99% CPU usage or extremely high temp of the Graphics Card. talking of Graphics, which card do you use?

CPU stays about 35%, however I've established it's a lack of airflow combined with the GPU. Hardware issues.
