Why would you buy a Geforce4 Ti 4400/4600 for $200 when you could have gotten a GeForce FX 5200 for $98? I saw one at Walmart today while I was there at that price; I was tempted to pick one up, but my GF4 4400 is good for now. And for those of you who say, "The GFFX burns up too fast, it's crap", that only applies to the 5800 Ultra. The 5200 and 5600 run fairly cool. The 5900 will r0xx0rs.

The Geforce FX 5200 is not at good as the Geforce 4 Ti series believe it or not. The 5900 will own, but the 5200 and 5600 were flops.

have you actually used the GF FX 5200?

to say it is a flop is a huge ignorant statement on your behalf. I recently went out to replace my ol dependable GF 2 MX400 for my gaming system at home, i was on a tight budget, so that meant no 5900 for me. So upon inspecting box after box after box after review, i finally grabbed the FX5200 for about $99. Thinking i would just have a slightly better output etc... i installed and fired it up, then hopped in Renegade. other than the 120fps, the game was the same (well duh, no more graphics in Renegade). So i decided to challenge it, opened up PlanetSide (a very graphicly intense game) and set all the detail to max. Along with my constant 80+fps and the remarkable detail that was flashing before my eyes.. . i fell in love with the card.

Now, you may ask, well have you tried the Ti series?

yes, i have a GF4 ti 4400 at work, and it isn't quite as graphicly crisp and clean as the FX. So, until you can put some real life knoweledge and experience behind that assonign statement you just made... keep your opinions to yourself. If you want to give recomendations to people on hardware, at least try the hardware out before you say it sucked because your sisters friends cousins read this article that it wasn't good on frogger.

~Dante

Hey Dante, would you mind taking a screenshot of what PlanetSide looks like using the FX 5200? I would like to have a glimpse of just how right I am that it is very much worth buying. Although Renegade itself would not benefit, there is a greater chance I'll be getting SWG in the near future, and I know such a game can and most likely will be graphic intensive.

Yes I had a Geforce 3 Ti 200, and I exchanged it for a Geforce FX 5200, once I had the 5200 in place I did not see much of a change, except for some sort of artifacts in Renegade, so basing my experience on the fact that I had more problems with the 5200 than my Geforce 3, I am going to trade in my 5200 for a Geforce 4 Ti 4600. To to http://www.tomshardware.com and check out the review for the 5200, the Ti 4200 beats it in most benchmarks! So who here has the experiance?

Check it out, what card outperforms whom?
http://www6.tomshardware.com/graphic/20030311/geforcefx-5600-5200-03.html

Check out some of the images Dante has taken on his FX card, I can say that the concerete looks much better than on mine. The JPEG format does however limit the quality on the cards though.

http://www.renevo.com/forum/showthread.php?s=&threadid=95

The second post in the topic below is a screenshot on my GeForce Ti 4200 Overclocked to 650/305 (nearly Ti 4600 spec) if you need a comparison. Note the first image has been filtered, so use the ones in the other posts.

http://www.renevo.com/forum/showthread.php?s=&threadid=44

Maybe we should do some high resolution image tests because i'm sure that the FX 5200 has better quality then mine, just would like to see the difference though.

That 5200 FX won't last a second in Doom 3, maybe 10FPS on low detail. Also the reeason why the FX get's so hot is because it uses DDRII and it's core is 500Mhz so it runs as hot as 80c.

i believe you are thinking of the 5800, as always people always remember that flop, and complain about all the 5200s.

i have ran planetside, graphics up on max for over 20 hours, and had a constant temp in my cpu @ the vid card around 60f

so, if you don't expect your system to stay cool as i do, and prepare for high processing as i do, then yes, you will get an overheated card/board/drives/etc.

do all yourselves a favor, buy some cooling systems for your computers

http://www4.tomshardware.com/howto/20030610/index.html

That site shows you how to install some serious cooling. In the review they managed to cool down a Pentium 4 3.06Ghz with HT to -52 Degrees Celcius then everclock it to 4Ghz! a massive

compared to some high end cases you can buy these days.

ya that is the problem with most people's system...They pile all these wicked products into their case and don't realize how much damm heat all that stuff makes.. On a minimum you should one intake fan and one outake that is not including power supply. It has it's own role...the power supply... :rolleyes:

Water Cooling is a good option for almost any system and especially if you like/want/do overclocking of your CPU or Video card. My next computer is gonna have water cooling...Air cooling is just getting too loud...

Subject: 100$ geforce 4 ti brand new
Posted by General Havoc on Mon, 16 Jun 2003 21:23:59 GMT
View Forum Message <> Reply to Message

An intake and an exhaust fan make a hell of a difference. I used a 40mm fan off an old CPU coolder for my exhause fan and it gets rid of the heat very well, when I touch the side of my case it is no longer hot as the heat is getting takes out of the case.

Compresser cooling (same idea as fridge) is a good method. It's fairly new and there are cases for

almost 3 times colder then your freezer (-18 degrees average freezer). Although it's only for the CPU, silent fans or more silent methods of cooling can be used on video cards and such. A heat pipe and thermal jacket on a video card are as effective as a cooling fan and heatsink.

I turned on my AMD K6/2 266Mhz last night to store some files. When i came back to the room it was in i didn't even know it was on. You can see how much heat these new computers make now.

The nVidia GeForce FX5200 is an entry-level card - reviews compare it to the ATI Radeon 9000 Pro and the 9200 Pro, as well as the nVidia GeForce4 MX line, not the Radeon 9500/9600/9700/9800 line or the nVidia GeForce4 Ti lineup.

Here's a quote from the Tom's Hardware article linked above:

Quote:
By contrast, we were more pleased by the FX 5200 Ultra. With respect to performance, the card can hold its own quite well against the Radeon 9000 PRO/ 9200.

......

In the entry-level segment, the FX 5200 Ultra is therefore a good choice. It's not certain, however, as to whether the moderate performance of the card really allows the DirectX 9 features in games to be used. Tests with modern games such as Splinter Cell or Aquanox 2 (internal tests with DX 9 Beta Patch) show that the card is actually too slow for this.

My point is not that the FX 5200 is a bad card - it's just that it is an entry-level card, not something that one can compare with the Ti 4200, 4400, or 4600, or with the Radeon 9500/9600/9700/9800.

Another thing - this is all considering the FX5200 Ultra, not the FX5200 normal, which is considered by many to be at GF4 MX420 / Radeon 7500 levels.

Later tests that compared the FX 5200 Ultra with the ATI Radeon 8500, 9100, 9000 Pro, and 9200 (non-Pro) have shown that they are all at about the same level. Each has its own advantages and disadvantages, which is also affected by drivers, etc., but because of the pricing difference, the best 'bang for the buck' out of those four would be the 8500. The best performance for a decent price in this range would be the 9200 Pro, but that, along with the FX5200 Ultra, approach the price range of the 9500 Pro, which is a whole lot faster than both of them.
