After getting wireless internet (on the G card) ive noticed that my gaming speeds have slowed drastically.....yet my connection from speed reports show that im still extremely high. Idunno whats going on!

P2P download speeds (from kzaaa winmx ect) are lowered from 150kbs to now 6 kbs! But from websites its still like 150+! Im getting a strong 54.0mbps through the card.....my friend has this problem too, how do we make it get back to normal? Is it because of the firewall or something?do I disable/fix this?! Thanks!

Wireless Cards where not made for gaming... The are for network file transfer and portability.

You should be able to get at least 1 megabit over the connection though. Unless you bought a \$10 USB wireless network adapter. Also your not sitting in lead shelter by any chance, in a thunderstorm?

You won't game the same speeds from Kazaa from Websites, and like he said, wireless are not meant for gaming
