Everything is connected to eachother but when i join and play Brenbot doesnt do anything. So the commands dont work ingame and auto announce also doesnt work, in fact nothing works ingame.

When i type !help on IRC it works but then when you type !sethoin it says you have to be ingame, but ingame it doesnt work.

Whats wrong and how can i fix this.? :rolleyes:

Check your renrem configuration, apperently it can't send commands ingame so it will not send anything, making it appear nothing works ingame.

Remember the renrem password needs to be 8 characters in length in Win32 mode. See the readme for details.
