first i would like to say.. great work

i have a little question about mod support. i know that renguard support ren alert, reborn and sole survivor. but if i wanna make renguard support my tc what do i need axactly to change? do i just need to add: gamename = Ra2Vengeance and everything will work fine(check up for the cheats and compare files between client and server)?

thanks you and keep up the good work!! Renguard is simply awesome!

That was just an example. Set in GameName whatever you want. If a mod becomes available, we need to add it to the database and we will set a GameName that should be set for all servers running that mod.
