Depends on what you need it for. Macs are generally better for graphics. windows is more secure/dependable, and Linux is supposed to be good for networks.

almor999Depends on what you need it for. Macs are generally better for graphics. windows is more secure/dependable, and Linux is supposed to be good for networks.

Windows is "secure & dependable?" You can't be serious. :rolleyes: The advantage of Windows is its wide user & application base, as well as some things for the office. But dependable? No.

Windows is about as undependable as an OS can get. The ONLY application that ever crashes on my Mac is Virtual PC, and it's always because Windows mucked something up.

Subject: Which is better?

Posted by [msgtpain](#) on Wed, 14 Apr 2004 03:09:43 GMT

[View Forum Message](#) <> [Reply to Message](#)

for being so "undependable" my box is sure dependable..

It's been up 42 days now without a reboot, and that's full use between 3 people including a kid who plays games and hits every button 5 times..

Windows XP simply doesn't crash.. at least mine never has.

As it has been said before, Windows just plain sucks; however everyone else uses it. That is the ONLY reason why we still use Windows. Mac OS will only sell with Apple brand computers; whereas, almost every other computer uses Windows.

Linux is great for buisness-type operations; ie: networking, stocking/shipping records, merchandise databasing, ect.

Mac OS, especially OS X, are definately reliable systems. They are also excellent machines for producing/editing graphics, as stated before. However, it lacks the diversity of software as compared to that of Windows.

In the end, it all depends on what the individual person wants.

z310i have a funny movie about mac, ill upload it tomarrow.

I hope it's good. Does he make people ill? Does he learn how to type improper sentences? Perhaps a consistency to mis-spell words? Or maybe spam?

Better yet, he might learn to do ALL 4 in the 1 post!!

Case in point... my box at work, I kept Windows XP up for 8 weeks straight and only had to reboot because I accidentally unplugged the PS/2 mouse and it wouldn't work. The USB is broken on the board for some reason.

And yet I install Fedora on it and I can't keep it online for more than a week without something going whack.

But overall, Linux is awesome for servers and stable as hell. The n00bstories box has 149 days uptime and that's online because they had to power it down to change the UPS it was plugged into. But for a workstation, I don't really like it. I find XP to be quite stable, and if you keep up with the patches it's pretty secure.

[View Forum Message](#) <> [Reply to Message](#)

Alkalinewindows 2003 data center edition is the best.

Alkaline, its this kind of comment that gets you flamed!

Why is it the best?

I would imagine that a large number of rational people would come to the conclusion that all OS'es have their strengths and weaknesses.

I know that 2003 datacenter has support for systems with larger numbers of processors and large amounts of memory, however the Windows version that supports the most processors and ram is actually:

"Windows Server 2003, Datacenter Edition 64-bit"

Additionally most people usually have a budget and I don't think I gain much advantage when playing Renegade from running the datacenter edition of server 2003.

So the best (most cost effective) OS for me to run Renegade is arguably "Windows 2000 professional".

As this provides me with a nice balance between cost and stability.

I do agree that Windows XP is a huge step forward from '98 (never used 2000 or ME). I did got it to crash a few times, but usually you can just shutdown the problematic application, where with '98 the whole system would hang.

Security is another thing, but that Windows is that bad with it is partially because it is used so widely.

z310I asked so it would be helpful next time i decide to buy a computer, i guess i'll start looking at Macs now

Apple just put out a new eMac deal for \$999, I'd suggest checking it out as it's a good deal.

I've used Windows (3.11-XP), Linux (Red Hat 9 Pro), FreeBSD, and a shitty old IMac. I can say that 2003-XP have been stable, along with FreeBSD. It just depends on what you want to do.
Windows = Gaming *nix = hosting OS X = editing

Ironically they used Apple Quicktime to encode the file.

Its getting a bit old now - seeming parts of the MacOS X core is basically Unix (FreeBSD).

I don't mind mac's myself - heck I have a G4 Powerbook AND a windows box running windows 2003 server.

I didn't really like anything below MacOS 10 but I think they have really done some good things having Unix integrated in it. Still things change - maybe Longhorn will be more stable but its a long time off yet.

Windows XP, installed 18+ months (lost track...)

Max Uptime (37 days) power goes out a lot at work... thank god for my ups shutting down cpu after 20 minutes...

Crashes: only when my cpu burnt out, replaced it & the mobo without reinstalling (yes, that is possible...)

Dependability: awesome, runs fast, looks good, and i can get just about any kind of software to do just about anything for it, if not, any n00b can program it.
